Metaverse 101
What is the metaverse, and why will it change the way we live?
At the highest level, the metaverse is:

A network of 3D virtual worlds, focused on **immersive experiences**, **digital economies**, and **social connections**.

However, there is currently no single, and aligned-upon view of the metaverse.

Whatever the metaverse may evolve into over time, we believe that in its ideal state, it will encompass the following attributes:

- **Persistent**: Continuity of experience
- **Synchronous**: In real time
- **Ubiquitous**: Physical and digital
- **Interoperable**: Transferable across worlds
- **Open**: Individual agency for all
- **Immersive**: More than today's internet
- **Economic**: Functioning economies

Today, however, the term is used for technologies, platforms, and concepts that may not have all these attributes.

Metaverse 101 | Clarifying the concept of the metaverse

The lack of a standard definition and evolving understanding of the concept has people confusing it for other technologies. The metaverse is not a single technology, but leverages a collection of capabilities, some of which are listed below.

- **Virtual/Augmented Reality**: Technologies to access the metaverse, much like current hardware and software allow us to access the internet.
- **Blockchain**: Technology that will enable the metaverse to be decentralized, interoperable, and secure.
- **Web3**: Evolution of today’s internet giving ownership to metaverse users to create and capture value.
- **Video games/virtual platforms**: Immersive virtual worlds that create social experiences and economies in the metaverse.
- **Digital twins**: A real-time virtual counterpart of a physical object or process that can be used to build metaverse worlds.
- **Internet of Things (IoT)**: Network of physical objects that communicate with each other and can support physical/virtual integration.

The metaverse is a concept and will not be owned by a single company. It is also not a replacement for the physical world; rather, it will bring the virtual and physical worlds together in new ways.
### Metaverse 101 | Why is the metaverse trending now?

The technology, culture, and market have all come together over the last few years to bring this to life globally.

**Metaverse 101 | Benefits of the metaverse**

In its ideal state, the metaverse will provide numerous benefits to people, enterprises, and governments around the world.

### Benefits to people

**Immersive and engaging experiences**
- Improve social experiences without geographical restrictions (e.g., live events, concerts, gatherings)
- Immersive education and learning
- Immersive shopping experiences
- Simplified transactions
- Specialized services (e.g., access to remote healthcare professionals)

**New job categories**
- New metaverse-related and adjacent roles to enable its virtual economy
- Natural evolution of current “gig economy”: no geographical restrictions, work when, where, and how you want

**New ways to earn money**
- Play-to-earn models based on crypto economies to get customers more engaged
- Investing in digital assets (e.g., NFTs) for expected financial returns

### Benefits to enterprise

**New revenue streams and business models**
- Selling digital assets (e.g., NFTs, virtual goods)
- Building immersive experiences
- Launching new sales channels (e.g., virtual stores)
- Reimaging marketing and advertising initiatives
- Renting out land/storefront space

**New ways of working**
- Accessing global talent
- Practicing new ways to network and collaborate remotely
- Offering new methods of training/onboarding
- Increasing talent retention

**Improved operations**
- Improving safety
- Optimizing efficiency (e.g., energy usage, reduce footprint) thereby reducing overhead
- Enabling collaborative testing and simulation

### Benefits to governments

**Reimagined public services**
- Citizen services (e.g., healthcare, driving, etc.)
- Consulate and embassy applications
- Enhancing tourism and hosting immersive cultural events

**Enhanced quality of life for citizens**
- Urban planning: Optimizing city planning in terms of traffic, green spaces, etc.
- Climate change: Modelling emissions to understand and plan how to meet set targets
The metaverse represents a significant evolution of our current digital experience. Key mitigating actions must be taken to prevent potentially amplified risks across data privacy, cybersecurity, fraud, as well as, user health and safety.

The metaverse ecosystem
How will we experience the metaverse, and what will build its foundations and enable it?
The metaverse ecosystem | Overview

A fully functioning metaverse ecosystem will create new and meaningful experiences for society at large, enabled by a standardized set of tools, processes and digital assets, and underpinned by several foundational pieces of technology.

In the following slides, we will examine how these foundational technologies and enabling rails come together to shape the metaverse experience, which will change how we have fun, work, and come together as users and businesses. However, much is still unknown; we will also examine critical uncertainties that exist today with each element.

Sources: Matthew Ball, Coinbase, Deloitte Analysis
The metaverse ecosystem: Foundation
Infrastructure, virtual platforms, connectivity networks, and access hardware will create the technical foundations of the metaverse.
Infrastructure advancements are required for the metaverse to have the compute required for immersive experiences, as well as the fundamental features for decentralization and interoperability. This will largely be enabled by the cloud and blockchain.

**Why is cloud computing important?**
Cloud computing leverages a network of remote servers to provide computing services over the Internet. Crucially, the compute requirements of the metaverse far exceed the capacity of any readily available consumer hardware. Therefore, cloud computing will be fundamental in providing compute at scale. Beyond computing performance, cloud also offers the benefits of lower costs, flexibility, and security.

**How will the cloud enable the metaverse?**
- **Processing power and storage:** The cloud will provide the processing capacity capable of delivering high fidelity, persistent, and synchronous experiences, like a virtual world that updates in real-time for millions of users.
- **Distributed presence:** The cloud can also help limit network requirements by offering a distributed system that enables processing closer to the users’ physical location.

**Why is blockchain important?**
Blockchain is a distributed ledger technology that permanently records transactions onto a publicly-owned database. Blockchain is critical to interoperability and decentralization in the metaverse because it enables secure, verifiable transactions without the need for a centralized authority. This allows transactions to be tracked and verified between metaverse platforms, allowing users to seamlessly switch environments.

**How will blockchain enable the metaverse?**
- **Cryptocurrencies:** Blockchain-enabled currencies can facilitate physical and digital transactions without the frictions of exchange rates, high fees, intermediaries, or legacy payment rails.
- **Secure digital ownership:** Ownership of digital assets can be reliably verified through the blockchain, allowing the sale and trade of unique digital assets that facilitate a decentralized and interoperable metaverse economy.

In a full-scale, decentralized version of the metaverse, the cloud and blockchain can work together to further their individual impacts. This can be done by enabling individuals and businesses to share excess compute capacity on their devices with others. The blockchain would facilitate this transaction, compensating the individual/business sharing their compute resources with cryptocurrencies, while the cloud will allow the user to access the compute power. This is the same vision of the future that many have for autonomous vehicles; when your vehicle is idle, it can be used for ride-sharing, which the owner is compensated for.

While cloud will likely be the most efficient source of compute, uncertainties exist around the ability for these solutions to process the nearly limitless amounts of data required for the metaverse. For blockchain, it’s uncertain whether users will adopt cryptocurrencies at scale or if their volatility limits their value, and/or their complexity creates barriers to entry.

Virtual platforms

Tim Sweeney (founder of Epic Games) defines platforms as a place where “the majority of content that people spend time with is created by others.” With the metaverse, this can manifest in two ways: centralized and decentralized virtual platforms.

Centralized platforms

Centralized platforms are designed to help users navigate the metaverse, curating the experience. These platforms supply third parties (businesses or users) with the engine, dev tools, asset libraries, and services to create virtual experiences, but the platform makes the rules, controls governance, and owns the user relationship. This means the platform takes a greater share of economic activity.

Compared to today’s internet, centralized platforms are most similar to aggregators like Meta/YouTube, as they broker a connection between users and third parties. This model has the advantage of using customer data to create a truly personalized experience and take a lot of the “work” out of the process for users. Replicating this model in the metaverse, however, would mean of many of today’s problems relating to Big Tech dominating the internet would persist, and, in fact, be worse as the scope of what the centralized “metaverse owner” would control is alarmingly large.

Today, Horizon Worlds and Roblox are two examples of centralized platforms that enable users to build virtual experiences and socialize with others.

Decentralized platforms

Decentralized platforms are designed to enable third parties with the engine, dev tools, asset libraries, and services required to create virtual experiences in the metaverse. Users engage with the third party platforms directly, with the virtual platform taking a small fee. These platforms are most frequently built on blockchain technology and rely on DAOs for governance.

Compared to today’s internet, decentralized platforms are most similar to Shopify, in that they do not seek to control the user experience but equip merchants to have a direct relationship with customers. This model has the advantage of creating a true “meritocracy” where users can pick their favourite experiences; however, demand generation and scaling can be a challenge for any individual third party.

Today, Decentraland and SANDBOX are two examples of decentralized virtual platforms build on the blockchain, enabling users to buy, sell, and trade using their respective cryptocurrency (MANA and SAND).

Both virtual platforms have critical uncertainties. For decentralized platforms, it is uncertain whether the investment required for success will even be met, and if its users can organize and build. For centralized platforms, there are several tech giants jockeying for position and it is unclear how each will differentiate (or if they will all cannibalize each other).

Note: Tim Sweeney
The networking requirements of the metaverse far exceed broadly distributed capabilities today—so much so that each of the core elements of networking will require drastic improvement.

<table>
<thead>
<tr>
<th><strong>Bandwidth</strong></th>
<th><strong>Latency</strong></th>
<th><strong>Accessibility</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>This is the data transmission capacity over a given time period; it's typically measured in gigabytes per second (gbps).</td>
<td>This is the time for data to be sent, transmitted, received, and decoded; it's typically measured in milliseconds (ms).</td>
<td>This is the ability for users to access high bandwidth, low latency internet in an affordable and reliable manner.</td>
</tr>
</tbody>
</table>

**Why does bandwidth matter?**
The metaverse will require the transmission of immense volumes of data in real-time between millions of devices. For a massively scaled, shared, and persistent virtual world to operate well, it cannot rely on data stored locally as many video games do today. Instead, data must be cloud-streamed as it's needed. This means that we'll require far greater bandwidth than we have now, but what we don't know is how much bandwidth is enough.

**Why does latency matter?**
The more immersive an experience is, the more critical it becomes to have low latency (i.e., “lag”). Current experiences such as video streaming or online gaming have implemented clever solutions to mitigate against the impact of latency, rather than eliminating it. However, for highly immersive metaverse experiences these “fixes” may not be possible. If facial expressions and body movements cannot be captured, sent across the network, and unpacked instantly, experiences will inevitably enter the “uncanny valley” and limit overall adoption.

**Why does accessibility matter?**
Inclusiveness must be a key quality of the metaverse, yet internet accessibility continues to be a pervasive issue. High bandwidth and latency standards need to be consistently upheld, and not just in wealthy urban centers. This will require sizeable investment, but for the metaverse to deliver on its promise, internet connectivity must be available and affordable.

The exact networking requirements of the metaverse are largely unknown and it’s unclear when current performance will be “good enough.” In addition, current market dynamics encourage competition where cooperation may be required to meet these requirements (e.g., building rural networks, sharing network infrastructure to reduce latency).

Note: Highlighted icons represent primary network requirements impacted by the respective solutions.
Access hardware is the user’s entry point into the metaverse and include emerging technologies such as VR/AR headsets and haptic gloves, along with established consumer hardware such as laptops, smartphones, and tablets.

**VR headsets**
VR immerses users into a fully virtual environment that is 100% removed from the physical world through novel audio and visuals inputs.

**AR headwear**
AR blurs the distinction between the physical and virtual environment by overlaying digital information and/or digital objects onto the physical world.

**Haptics**
Haptics facilitate tactile feedback from virtual environments to increase users’ level of immersion and improve dexterity.

### Key challenges

**Resolution**: Pixel gaps are more noticeable the closer a screen is to the eye, creating resolution requirements for more realistic images.

**Refresh rate**: Images must be refreshed at a rate of 120Hz or higher to avoid nausea. Most hardware today is between 60-90Hz.

**Weight and safety**: Extended VR exposure can cause fatigue or nausea. A reduction in weight and battery size are required for comfortable use.

**Field-of-view**: Humans can see an average of 210 degrees; market leaders offer a far lower range of 25-55 degrees.

**Optics**: Optics are necessary to focus images correctly, but this creates brightness demands above the currently available technology.

**Cost**: Pricing currently limits haptic gloves to industrial use with an approximate range of $5,000 to $10,000 per set.

**Integration**: Haptics are not currently integrated into the majority of consumer apps and devices and are limited to specific purpose-built software applications.

The development of these technologies is inevitable, but questions exist over how quickly and cost effectively hardware manufacturers can overcome remaining challenges and whether VR / AR adoption is necessary for metaverse proliferation. Computers and smartphones may provide immersive metaverse experiences as well.

The metaverse ecosystem: Enablement

A functioning social and economic ecosystem will be enabled by effective governance, consistent tools and standards, and a robust payments network.
Enablement | Regulations and governance

Government regulations will inevitably shape the future of the metaverse, but at this time are impossible to predict. What can be assessed today are the differences in governance that emerge from centralized verses decentralized metaverse models.

Depending on which virtual platform model becomes the pre-eminent customer choice, the corresponding governance model will follow. That said, we are no closer to predicting where on this spectrum we will end up. It will either be dictated by government regulation or by which platforms provide better customer experiences and thus capture demand.

Enablement | Tools and standards

Tools and standards are the components of the ecosystem that can enable stakeholder trust, interoperability, and shape a more user-centric, personalized, and user-friendly metaverse community and economy.

Standards and protocols

Web1 was developed by academics, scientists, and the military who intended to create an interconnected web of computer networks. As a collection of protocols, they built web1 with the fundamental belief that no one entity should control or own the internet, which has promoted open innovation and competition.

In web2, “Big Tech” built platforms powered by these standards and protocols, creating amazing digital experiences but with the negative byproduct of creating walled gardens. The fundamental promise of the metaverse will not be met unless it is built with the same principles as web1; without them, the metaverse would just be a more immersive version of web2. The exact standards that define the metaverse are yet to be developed, but they will unlock the true power of the metaverse only by promoting:

- **Interoperability:** User data/assets (e.g., avatar, cryptocurrencies, virtual goods) and virtual systems (e.g., movement, rules, consequences) should be consistent and unified across virtual worlds.

- **Decentralization:** The “idealized” metaverse leverages mutually accepted standards to help realize the web3 vision where users have complete control over their data, assets, and experiences.

Early signs of industry collaboration to facilitate open standards and ecosystems are starting to emerge, with many key technology players from the foundation layer of the ecosystem coming together for initiatives like the Metaverse Standards Forum (MSF). But questions remain around how successful these collaborations can be, and of the players not involved in the forum.

Tools will also play an important role in realizing the promise of the metaverse:

- **Digital identity:** Users having a unique digital identity that can verify and protect their likeness, data, and assets will be key to “unlocking” interoperability. It can also help establish trust between users in the ecosystem and limit fraud by holding culprits accountable.

- **Avatars:** Avatars will help users in the metaverse maintain a sense of self, especially with interoperability between worlds. They can be used as a form of self-expression based on their appearance and accessories to establish a representation of our digital identity.

- **Artificial intelligence:** AI will allow metaverse users to interact with avatars that act in very similar ways to humans. The influx of data will also lead to improved user experiences by providing personalized services and offerings that better predict user needs and behaviours.

The determining factor between which metaverse standards become widely accepted and scaled will be where developers can make the most money. While centralized platforms typically take a large commission, they also provide access to a large audience. With decentralization, there are no commissions but it’s harder to gain scale.

Enablement | Payments and digital assets: Challenges

For the metaverse to have its own fully realized economy, users must be able to transact, and money must be able to seamlessly flow in and out of the metaverse. Today, there are critical challenges preventing this from being fully operational.

Current payment elements

Currency issuers are entities that issue and develop stores of value. Traditionally, this job is owned by the government and central bank of each country.

Payment rails are the underlying back-end processes that enable the flow of money through an economy. This allows the participants within an economy to transfer value among each other.

Wallets are a broad term for an entity that acts as a store of currency. Traditionally these are bank accounts, but there has been a proliferation of private wallets that enable new features for consumers.

Challenges to replicating these elements in metaverse

Barriers to decentralization
In proto-metaverses, non-government actors issue currencies. While crypto could be the optimal solution for consumers, those enabling the metaverse (e.g., Big Tech, financing banks, etc.) may restrict the degree of decentralization based on its impact on their profit pools.

Platform access and fees
Users must transact via rails that will have to be fast, secure, and scalable. Platform players today charge high fees on all transactions (e.g., 30% on iOS), which is unsustainable for mass adoption and growth of the metaverse economy.

Interoperability
Bank deposits are insured by government-backed agencies (e.g., CDIC, FDIC). Evolution of consumer wallets to enable currency interoperability (exchange fiat and crypto) and underwrite associated risks will play a large role in the metaverse.

Source: Deloitte Analysis
Note: Matthew Ball
Enablement | Payments and digital assets: Solutions

Fiduciary regulation, user trust, and interoperability will determine the payments solution(s) adopted by metaverse users.

<table>
<thead>
<tr>
<th>High regulation</th>
<th>Low regulation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Existing fiat currencies</strong></td>
<td><strong>Central bank digital currencies</strong>¹</td>
</tr>
<tr>
<td>This is the currency used to pay for transactions digitally. It is the country’s official currency and is backed by the issuing government and financial institutions.</td>
<td>This is a virtual form of a fiat currency, an electronic record, or digital token of a country’s official currency that is backed by the issuing government and financial institutions.</td>
</tr>
<tr>
<td><strong>All government-issued currencies</strong></td>
<td><strong>China, Nigeria, and the Bahamas have launched CBDCs, 11 countries are piloting it, and 10 have launched PoCs</strong></td>
</tr>
<tr>
<td><strong>Widespread adoption across various retail and business users globally</strong></td>

</tr>
<tr>
<td><strong>Centralization, privacy, regulation, and portability</strong></td>
<td>Centralization, privacy, regulation, and portability</td>
</tr>
</tbody>
</table>

Ultimately, the degree to which users trust each of the above currencies and the ability to use the currency frictionlessly will determine the scale of regulation in the market. Without stability in cryptocurrencies or the ability to use non-governmental currencies broadly, governments will intervene and establish CBDCs.

The metaverse ecosystem: Experience

The metaverse will change how people have fun, how people work, and how businesses come together with people.
Experience | How we have fun

The amount of time we spend on the internet having fun has grown exponentially, and the metaverse will continue this trend. It is already leading change in gaming that will be a natural metaverse launch pad for entertainment companies and users alike.

Gaming

Gaming represents the closest experience to the metaverse currently available, but the metaverse will fundamentally shift how we play games, with new models (play-to-earn), more immersive worlds, and more interactive multi-player experiences. Gaming engines will also fuel the evolution of the metaverse as a fundamental tool in real-time 3D graphics.

- **Epic Games** launched its new gaming engine, the Unreal Engine 5, in early 2022. With the expectation to power the metaverse, the new engine features enhanced UI, performance, and visuals.¹

Live events

Musicians have been early adopters of the metaverse, which will enable persistent venues where artists and audiences can come together from anywhere (e.g., live concerts in Fortnite). Virtual theme parks and sporting events could be other profitable metaverse applications, with VR providing a more dynamic viewing experience and reducing entry barriers.

- **Disney** applied for a “virtual-world simulator” patent in December 2021. Disney intends to develop this technology to project 3D images and virtual effects onto physical spaces in its theme parks.²

TV, film, and music

Monetizing the love for characters and stories of a loyal customer base, studios will create immersive stories in 3D. The interoperability of the metaverse will also allow these stories to expand to other experiences (including virtual merchandise). Branded virtual spaces, for example, could allow fans to engage with characters before/after watching a film in the metaverse.

- **ITV** acquired Metavision in mid-2021 to expand its content and IP into the Metaverse. Its goal with the acquisition is to develop its strategy to converge gaming and entertainment in virtual spaces.³

Socialization

In virtual worlds, life-like avatars will facilitate more immersive communication, driven by the capture of facial and body expression to deepen non-verbal signals, even while engaging in complex activities. The social experiences in the metaverse will also be far more immersive, with a sense of presence that cannot be matched by today’s video calls.

- **Virtual YouTubers (Vtubers)** are content creators across multiple channels that leverage the Unreal gaming engine and real-time motion capture to create 3D-rendered avatars that reflect the user’s facial and body expressions.

Each of the above experiences are already starting to emerge; however, their development depends on consumer adoption and technological capabilities. Potential ROIs on building these experiences today are impossible to predict; consumers may embrace the metaverse for these experiences, or there may be only a niche group of users that adopt them.

23
COVID-19 has accelerated changes in how we work. The metaverse will put these changes into second gear. Developments in how we do our jobs will overcome the challenges of work from home; changes in the jobs we do will be more pronounced.

The jobs we do

New career opportunities
The metaverse will open the door to a swath of new career opportunities. For example, play-to-earn careers will emerge that allow video gamers to earn money for their in-game achievements. The metaverse’s underlying decentralization also create new opportunities for individuals to capitalize on their skills – creating a brand-new virtual gig economy. For example, as more people become metaverse content creators, there will be a need for freelance content editors.

New "side hustles"
The metaverse will also broaden our opportunities to earn from our assets, investments, or our spare time. For example, with P2P networking, users will be able to earn money by “lending” dormant network and/or compute capacity to others. Users can also buy land in the metaverse and rent it to third parties with smart contracts or contribute to a collection of DAOs to earn tokens and/or shares and be rewarded by the success of the organization(s) they contribute to.

How we do our jobs

Collaboration
Most influential to the daily life of the average worker, the metaverse will re-imagine collaboration with existing solutions such as Horizon Workrooms and Microsoft Mesh. The metaverse will help re-humanize the work-from-home experience and allow for better collaboration. The sense of presence in the metaverse will make it feel like you are in the office, without being there.

Simulation
The ability to virtually simulate environments and situations will change our approach to training, testing, and predicting. For example, medical schools will be able to simulate open-heart surgeries virtually to train students. Simulations can also be used to train autonomous vehicles to drive in the streets of a real city, allowing it to predict the best routes and limit the potential for accidents.

Digital twins
Digital twins are real-time virtual replicas that evolve with data being sent back from the physical world. While they are already in use in manufacturing and logistics, the metaverse will enhance their scale and value. For example, digital twins can be used in mining to predict the safety of mines and the location of precious materials to save time and resources and reduce environmental impact.

The metaverse’s potential to impact how we work is dependent on three key factors: the ability for metaverse investments to generate sufficient ROIs (which impacts an employer’s willingness to invest in requisite technology); the ability for employers to upskill their workforce; and employee willingness to adopt the metaverse in their careers.

Experience | How businesses and users come together

The metaverse enables consumers to discover and interact with brands in innovative ways and enjoy new and existing products in a virtual world. The specifics will vary by industry and by product, but commonalities exist across the customer journey.

Brand discovery experiences
The metaverse expands upon common brand discovery tactics in the real world, offering new ways to reach customers and capture their imagination.

**Dynamic in-world advertising**
Brands can take advantage of new virtual ad units, including billboards in high-traffic virtual spaces, 3D pre-roll ads before 3D content experiences, or more targeted and personalized ads based on user data.

**Brand activation in community spaces**
Brands can also build brand activations within big virtual events (e.g., concerts) or create their own community spaces where consumers can interact with other fans and experience the brand in a new way.

Product discovery experiences
Virtual worlds add immense value by enabling consumers to experiment with products in ways that are often physically impossible in the real world.

**Virtual stores**
Brands can build virtual stores that are replicas of physical stores or unique virtual spaces that allow consumers to find and experience products and/or services.

**Try now, pay later**
Consumers can virtually test out how a product looks, feels, and/or works before buying them in real life.

**Controlled product exclusivity**
Brands can fully control distribution of products through exclusive events that leverage scarcity to create intrigue.

Purchase experiences
Purchase experiences in the metaverse will blur the lines between physical and virtual worlds. Different industries will use different models based on needs.

**Buying virtual goods in virtual worlds**
The most common model: brands must consider how to convert customers who have entered their virtual store or engaged with their product virtually.

**Buying physical goods in virtual worlds**
This applies to brands using the virtual world to test physical products (e.g., clothes) or ease of access (e.g., quick service restaurant). It requires real-world operations to deliver products.

**Buying virtual goods in the physical world**
Brands can create stickiness by augmenting real-world purchases with virtual goods – either virtual replicas, net new virtual products, or access to virtual events.

The degree to which businesses can integrate the metaverse into their marketing and sales relies on the customer experience. Select iterations of AR/VR enabled product discovery experiences exist today but without widespread adoption. There are limitless possibilities for new brand experiences in the metaverse, the above are just the tip of the iceberg.

The future of the metaverse

What might the metaverse look like in the next 5 to 10 years?
The future of the metaverse | Driving forces and uncertainties

Driving forces
Below are the current trends in the broader market, which will influence the future of the metaverse.

**Substantial increase in metaverse investments**
Multiple Big Tech firms have committed billions of dollars to grow the metaverse. For example, Meta has invested $10 billion in VR alone.¹

**Emergence of web3**
Separate from the metaverse, advancements toward web3 will unlock the potential for a more decentralized internet.

**Growth in media attention**
According to Google Trends, searches for “metaverse” exploded in 2021 due to the increased coverage from Facebook’s name change to Meta.

**Proliferation of virtual experiences**
With work and education now commonly conducted virtually, the COVID-19 pandemic accelerated the amount of time people spend online.

**Commercial availability of technology**
AR and VR technologies are no longer prohibitively expensive and are readily available for consumers to purchase.

**Younger generations’ tech adoption**
Each subsequent generation is spending more time with technology, which will fundamentally shape how they see the world and will lead to transformative change.

Uncertainties
The future will be shaped by the outcomes of the following five critical factors, each of which is highly important and highly uncertain.

Critical uncertainties

- **Degree of centralization**
- **Consumer demand for virtual experiences**
- **Degree of physical and digital convergence**
- **Degree of interoperability**
- **Pace of technological capabilities**

Big Tech's big dream

In this scenario, a few key players in Big Tech have a large degree of control and responsibility defining and building out the metaverse.

With the continued release of products and services that build a stronger user experience, consumer demand for the metaverse continues to grow. The mass revenue opportunities created by this consumer demand spur continued investment in a metaverse that truly integrates every aspect of our physical and virtual worlds.

Cool experiences only

In this scenario, Big Tech heavily invests in the metaverse to realize “Big Tech’s Big Dream.” However, consumer demand for physical/virtual integration is limited coming out of the pandemic. Frustrated by a barrage of more immersive experiences that require costly hardware, consumers reclaim physical lives and rely less on tech for new experiences.

With heavy investment but limited return, Big Tech players refocus their metaverse investments to develop for more specific use cases where a more immersive experience adds value for a certain segment of the population (e.g., gaming).

Choose your own adventure

In this scenario, the vision of web3 is fully realized: control of the internet is now in the hands of individuals and businesses of all sizes. Regulatory bodies play a role in establishing the underlying protocols and standards.

In parallel, younger generations that grew up with the convergence of our digital and physical worlds continue to embrace the virtual experiences promised by the metaverse. Much of the physical world also exists virtually in a tokenized and decentralized manner via blockchain.

Meh-verse

Coming out of the pandemic, the consumer’s preference for physical interaction emerges above the hype of the metaverse and immersive virtual experiences are largely ignored. With flat demand, Big Tech’s investments in the metaverse slow.

With Big Tech largely out, individuals and small businesses try to build the metaverse themselves. These experiences are hyped and may even make a splash, but are ultimately very shallow and those that invested could come out on the losing end over the longer term.

The future of the metaverse | Big Tech's big dream

The vision of metaverse as imagined by a few key players in Big Tech is wholly realized: a fully immersive, virtual world run in parallel to the physical world with mass-scale adoption.

**Experience**
- **Play**: Gaming will be an integral part of the metaverse with creators and organizations using it to engage audiences and earn revenue, going beyond the scope and limitation of the current gaming ecosystem.
- **Socialize**: The metaverse will ingrain itself in the social norms of society and become fundamental to how we communicate. It will be enabled by fully immersive experiences that foster a deep feeling of presence.
- **Transact**: Virtual economies will thrive with the mass adoption of NFTs and crypto; however, Big Tech players will earn a set commission on the majority of transactions being made in the metaverse.
- **Create**: An amplified creator economy will add to the virtuous cycle between consumer adoption and investment.
- **Work**: Organizations fundamentally integrate the metaverse into their ways of working (e.g., using virtual offices to facilitate hybrid work arrangements).

**Enablement**
- **Regulations and governance**: These are influenced by Big Tech, which takes the lead in setting norms and developing new forms of governance.
- **Payments and digital assets**: Digital currencies will be used as the main payment method in both the physical and virtual worlds.
- **Tools and standards**: These are established by Big Tech who builds the underlying tech, but influenced by players across the spectrum.

**Foundation**
- **Access hardware**: AR, VR, and immersive experiences thrive and become affordable for wide-scale consumer adoption.
- **Platforms**: Multiple platforms operate in conjunction; however, Big Tech owns the foundational elements of the platforms.
- **Networks**: Heavy investment will lead to important new innovations in networking protocol and technologies.
- **Infrastructure**: The virtuous cycle between consumer adoption and investment from Big Tech support and grow the infrastructure.

Source: Deloitte Analysis
The future of the metaverse | Big Tech's big dream

What does this mean

- Big Tech invests heavily in developing affordable access hardware and enabling the growth of the creator economy and developer ecosystem.
- Big Tech acts as the integrator and enabler of required technologies (e.g., crypto, blockchain) to build the ecosystem.

Key takeaways

**Big Tech extends its prevalence to the metaverse**

- The metaverse will not be owned by any one player, or the Big Tech players collectively, but since these companies will be deeply entrenched in defining and building the metaverse, they will be the primary creators for the foundational elements of the virtual world.

**A new “virtual” economy is created**

- The new virtual economy will seamlessly integrate the physical and virtual worlds, providing endless opportunities for key players to identify new revenue streams and business models in the metaverse. New full-time jobs will also become prevalent in the metaverse.

**Select industries and sectors face an existential crisis**

- As the metaverse becomes an integral part of society, it will create an existential crisis for some industries and sectors (e.g., commercial real estate, travel) that rely on current interaction models. These industries will have to transform with the metaverse to survive.

Use cases

- **New revenue and business models**
  - The metaverse will provide businesses with novel ways to generate revenue and engage with potential customers (e.g., selling digital assets or NFTs).
  - Nike has started selling digital sneakers as NFTs in the metaverse.¹
  - Epic Games partnered with Balenciaga to bring high-fashion skins into the game, available for purchase.²

- **Immersive and engaging experiences**
  - The metaverse will improve social experiences, provide immersive shopping experiences, and create new travel and tourism opportunities. It will also support access to specialized services (e.g., remote health-care services).
  - Fortnite organized the “Rift Tour” that featured Ariana Grande.³
  - Decentraland organized Fashion Week in Metaverse in its “Luxury Fashion District” featuring fashion houses, brands, and designers.⁴

The future of the metaverse | Choose your own adventure

The vision of web3 is fully realized: users will be able to create content while owning, controlling, and monetizing it through the blockchain and cryptocurrencies.

**Experience**

- **Play**
  - Gaming will grow significantly with the rise of decentralized virtual worlds and play-to-earn models.

- **Socialize**
  - Users will embrace all virtual and immersive social experiences such as shopping and attending events.

- **Transact**
  - Virtual economies will thrive through the trade of interchangeable virtual-world cryptocurrencies, NFTs, and other digital assets.

- **Create**
  - The creator economy will flourish with users having complete freedom on developing, owning, and monetizing content. As sole custodians, they will also have to take responsibility to protect their data and assets.

- **Work**
  - Users will participate in DAOs to shape how businesses operate. Companies can operate wholly-owned virtual experiences that exist in a broader decentralized ecosystem. Big Tech may play a role, but with open-source code and transparency.

**Enablement**

- **Regulations and governance**
  - Regulations are made by the people through DAOs, and community-led governance structures will prevail.

- **Payments and digital assets**
  - Crypto dominates payments; digital assets represent in-world ownership. Both are stored in self-custody wallets.

- **Tools and standards**
  - Vision of web3 is fully realized, and a self-sovereign digital identity helps users access services and transfer data.

**Foundation**

- **Access hardware**
  - The metaverse is primarily accessed through XR hardware technology (e.g., AR/VR headsets, glasses).

- **Platforms**
  - Decentralized worlds are the dominant platforms leveraged by users to engage with the ecosystem.

- **Networks**
  - Decentralized P2P wireless networks will take precedence over current networks.

- **Infrastructure**
  - Decentralized technologies (blockchain, decentralized storage) are used for the governance of data.

Source: Deloitte Analysis
The future of the metaverse | Choose your own adventure

What does this mean

- Users have accessibility to and can afford immersive access hardware that fuels rapid and wide-scale adoption.
- Users understand the benefits of decentralization through education and the ability/opportunity to apply it.

Key takeaways

- The vision for web3 is realized
  People will have complete control over their data, and through decentralized technology, will have the power to directly shape regulations and world order.

- Finance is decentralized
  The world economy will operate through cryptocurrencies and NFTs stored in self-custody wallets that leverage blockchain-based smart contracts and limit the reliance on intermediaries (e.g., banks).

- Firms transform into decentralized organizations
  Many metaverse-oriented firms will take on new governance models, transforming into DAOs to remain relevant in their specific industries. Some organizations will hold out but offer very specific, centralized services.

- The physical and digital worlds amalgamate
  Virtual economies and experiences will be as, if not more, prevalent among younger generations in comparison to the physical worlds. But the two worlds will collide and interact seamlessly.

Use cases

- Peer-to-peer lending and borrowing
  The metaverse will enable individuals to lend or borrow cryptocurrency and decentralized exchanges without the need for banks, exchanges, or other intermediaries.

- Transparent supply chains
  The metaverse will allow for people and organizations to have complete visibility into supply chains to track the movement of products from raw materials to end users.

- AAVE: It now has a decentralized non-custodial liquidity market platform.

- Marks & Spencer: It provides interactive mapping of its food and apparel manufacturers.

- Patagonia: It has mapped a subset of raw materials and factories that make its products with focus on vendor operations and staff details.

32
Despite intensive investment, the consumer demand for the metaverse fails to coalesce due to digital fatigue. This results in several tech giants competing for a smaller than expected pie, increasing the level of specialization and centralization.

**Experience**

- **Play**: Gaming is most disrupted by the limited metaverse, with Big Tech players taking share from legacy gaming systems and manufacturers.

- **Socialize**: The socialization aspect of the metaverse will be muted with most consumers preferring real-world interaction and live events due to pandemic-imposed digital fatigue.

- **Transact**: Purely digital commerce, such as avatar clothing, will be limited; however, there might be potential for brands to increase customer affinity through new and unique experiences.

- **Create**: Interest in community-driven content is minimal, reducing the incentive to curate and create custom content.

- **Work**: Current ways of remote working (e.g., video chat) are preferred to avatar interactions, but there are significant industrial applications for proto-metaverse technologies (e.g., digital twins).

**Enablement**

- **Regulations and governance**: Regulation does not restrict Big Tech’s influence on the metaverse.
- **Payments and digital assets**: Payments are made through the rails currently utilized by Big Tech; NFTs remain popular for collectibles.
- **Tools and standards**: Big Tech players guard their own networks with unique standards that lead to limited interoperability.

**Foundation**

- **Access hardware**: Consumer applications are accessed through VR; limitations (e.g., resolution) prevent fully immersive experiences.
- **Platforms**: Platforms are primarily applications centrally maintained by Big Tech. Lack of demand precludes immersive worlds.
- **Networks**: Recent bandwidth and latency improvements (e.g., 5G, Wi-Fi 6) are sufficient to support traffic requirements.
- **Infrastructure**: Lower than expected demand allows Big Tech to maintain sufficient storage and computing power with existing tools.

The future of the metaverse

Cool experiences only

What does this mean

- Big Tech refocuses investment to leverage existing core competencies.
- The ecosystem seeks advertising spend primarily from premium brands.

Key takeaways

Big Tech refocuses metaverse investments
Early investments in the metaverse do not go as far as Big Tech would have hoped, leading each to refocus efforts in their areas of expertise in VR headsets, enterprise software and gaming, and immersive social platforms.

“Legacy” media remains king
Media viewed on “traditional” channels wins out. Consumers will prefer to spend more leisure time on their phones, tablets, and televisions than in the metaverse for its accessibility and value. These mediums also leverage pseudo-metaverse experiences to maintain relevance.

Premium brands find value
Brands can more effectively target core audiences with uniquely customized interactions that deepen customer relationships and build brand affinity. These relationships allow premium brands to uphold and expand premium pricing strategies.

Use cases

Immersive gaming
Game designers and console producers leverage the power of connected VR to create more immersive gaming experiences.

Epic Games: It emphasizes the social aspects of gaming through large multi-player experiences.¹

Beat Saber: This virtual reality game combines immersive visuals with popular music to create a physical/digital experience.²

Augmented training / performance
Militaries, heavy-manufacturing companies, and the healthcare industry utilize AR to train personnel in hazardous tasks by overlaying real-time information.

Mercedes: It uses AR glasses to support technicians with real-time assistance.³

The US Army: It uses AR glasses to provide improved access to real-time information for infantry in the field.⁴

The future of the metaverse | Meh-verse

This scenario is a failed metaverse. A meh-verse features significant consumer resistance. Without consumer buy-in, investments in the metaverse are limited and communities form to establish a version of the metaverse that has exciting, but shallow, experiences.

New gaming experiences (e.g., cross platform avatars, play-to-earn, VR simulations) revolutionize gaming, popularizing a handful of games before major producers adopt these new experiences.

Decentralized social media sites are available but lack the network effects of major services. Smaller communities form around these sites but are reserved for a handful of fanatics.

NFTs and virtual world cryptocurrencies thrive in in-game economies but don’t reach mass adoption, limiting their real-world value.

Creators are able to develop projects in the metaverse and contribute to projects developed by DAOs, although they are unlikely to see huge commercial success since they are limited by the lack of large scale audiences.

Small DAOs assemble to capitalize on the virtual economy and play-to-earn gaming models, allowing creators (particularly in developing economies) to earn a living in the metaverse.

Source: Deloitte Analysis
The future of the metaverse | Meh-verse

What does this mean

- Users create metaverse experiences for themselves with decentralized autonomous organizations (DAOs) to manage them, as needed.
- Niche community groups are established to engage in metaverse experiences with like-minded individuals.

Key takeaways

**Big losses for tech players**
The significant investments Big Tech players are making in the metaverse yield limited returns, forcing Big Tech to rely on existing revenue streams for growth.

**Decentralized communities build the metaverse**
With Big Tech not realizing the requisite returns, communities with niche interests (e.g., gaming) come together to build metaverse experiences with the fundamental belief that they should be decentralized.

**Shallow experiences define the metaverse**
The decentralized communities that build the metaverse will develop it without commercialization in mind. Metaverse experiences will be enticing but lack the depth of experiences built by Big Tech.

**Web3 features arise but we never leave web2**
Current aspirations for web3 will not be realized but inspire fragmented adaptations to web2 (e.g., artists and creators that individually govern the distribution of their content).

Use cases

**Try now, pay later**
AR provides consumers the opportunity to see how products would look in their home or on themselves before purchasing them.

- **Adidas**: It’s a new AR app allows customers to try on sneakers before buying them.¹
- **Ikea**: Ikea Place is an AR app that allows users to visualize furnishings in their home before purchasing them.²

**NFT access passes**
NFTs can be used to grant rights holders access to private events where participants are verified through the blockchain, restricting the ability for bad actors to forge fake tickets.

- **Kings of Leon**: This band launched a “golden ticket” NFT that provides special access to concerts.³
- **Coachella**: The event now has an NFT collection that allows users to own festival passes, digital collectibles, virtual adventures, and more.⁴

Key considerations and next steps
What must you consider to launch your organization's future in the metaverse?
### Key considerations | What questions should your organization consider?

**Consumer**
- Does offering new products or services align with our overall brand and strategy?
- Are our customers the type that will use the metaverse?
- What new products or services can we launch in the metaverse? How do these align with our current product portfolio?
- What opportunities exist to create converged digital and physical experiences?
- Does it make sense to have a virtual storefront in the metaverse?
- How can we leverage the metaverse to build loyalty with current customers or acquire new customers?
- How can we use digital twins for process optimization, inventory management and, production processes?

**Energy, Resources & Industrials**
- What physical resources and infrastructure will be required to develop hardware for the metaverse (e.g., metals)?
- How can we leverage the metaverse, digital twins, and simulations to improve on-site safety and enable integrated remote operations?
- How might the metaverse be used to upskill new workforces and create greater talent mobility for the industry?
- How do we navigate the regulatory processes and approvals to employ metaverse-related technologies?
- Given the above, does the metaverse have sufficient value proposition for ER&I companies? If so, what are the risks and barriers?

**Financial Services**
- How do we manage the interoperability of currencies (traditional, crypto, digital assets, contracts) between worlds in the metaverse, as well as in and out of it?
- What product will emerge as the first broadly accepted consumer wallet to house assets and contracts? Do we want to develop this? How?
- How do we properly collateralize lending in the metaverse considering the novelty of digital assets and a lack of established history on price stability?
- Will customers want to interact with traditional financial institutions for transactions in the metaverse?

**Government & Public Services**
- To what extent do we need to regulate the metaverse to balance competition, innovation, privacy, and security, and the potential impact of the metaverse?
- How do we oversee and manage the issuance of government IDs in the metaverse? How can we authenticate these IDs?
- How might the metaverse change the way we interact with and deliver services to our citizens? How will governments operate across levels and with each other?
- How do we upskill our resources and collaborate with tech companies to stay up-to-date on the latest technological developments?

**Technology, Media & Telecommunications**
- Technology
  - What new products and services can we build to bring the metaverse experience to life?
  - What is the path to monetizing these new experiences and ensuring consumer adoption?
  - How important is ROI in the short-term?
- Media
  - How can we make our content relevant to our target audiences in the metaverse?
  - How can we include new or existing ad inventory in the metaverse and optimize between mediums?
- Telecom
  - How can we generate sufficient returns on network investments that support the metaverse?
  - What partnership opportunities exist to differentiate our networking services?
Next steps | How can your organization enter the metaverse?

**Envision**
Explore and experience the metaverse for yourself to better understand its potential. Set a vision for the future and make a commitment to experimenting with and investing in new experiences for customers and/or employees.

**Define**
Identify priority use cases to start experimenting with leveraging Deloitte’s Metaverse Activation Framework, which helps organizations identify the right experiences to invest in. Define the ideal-state customer experience, and understand the capabilities needed to bring that experience to life.

**Build**
Invest in building metaverse-enabling capabilities such as data and analytics, cybersecurity, cloud-based architecture, and modern connectivity protocols. These capabilities are fundamental to the metaverse but are also an essential part of modernizing organizational tech capabilities and are “no regrets.”
