6. Walking the talk
7. Contacts
The strategic things you do to grow your business or achieve your mission are at the heart of the cyber risks your organization faces.
Traditional security controls, preventive measures, and compliance initiatives have probably consumed the lion’s share of your investment in cyber risk management, and you will most likely need to continue — or increase — your investment levels, because the stakes have never been higher.

But you may need to rethink your decision criteria. Malicious actors, especially those motivated by financial gain, tend to operate on a cost/reward basis; if your defenses are strong enough to raise their risks and level of effort relative to the value of what they can gain, they are more likely to turn their attention elsewhere.

“Value” is a pivotal qualifier. Given the reach and complexity of your digital ecosystem, you can’t secure everything equally. Being secure means focusing protection around the risk-sensitive assets at the heart of your organization’s mission — the ones that both you and your adversaries are likely to agree are the most valuable.

Among the most important elements are critical infrastructure, applications, and data, as well as specialized control systems — but they’re not isolated components. They’re part of larger services and transaction chains, so it’s essential to address weak points along the end-to-end business process, with the awareness that insiders, vendors and trusted partners at any point can be the source of errors or intentional actions that open the door to incidents.

If you’ve historically underinvested in security, this should be remedied, but improving security is not always about spending more money — and it’s also not just about buying the latest security tools. Many organizations can do significantly better by instilling better discipline in some basic areas.

One is data tracking and classification. Many organizations don’t know where their sensitive data actually resides. It’s probably sitting in more places than you think — both inside and outside your organization — being viewed and shared by more people than necessary. Effort should be taken to streamline and control access wherever possible.

Another common and closely related area of weakness is asset management. Large organizations generate enormous change on a daily basis — new users, new devices, new applications, and supporting changes to the underlying infrastructure. If security controls are not adjusted to keep pace, you’re likely to create gaping holes that can leave your organization exposed for days, months — or even years.

A closer look

Strong asset management is a significant enabler of secure, vigilant, and resilient practices.

For example, proper reconfiguration and decommissioning of laptops and servers is critical in preventing data leakage. Mature processes maintain up-to-date tagging of critical assets that support high-risk areas of the business.

This intelligence can be used in conjunction with monitoring technologies to prioritize attention to security alerts — helping analysts discern the difference between a minor event and one that could potentially escalate into a business crisis.
Today’s costliest attacks tend to be the ones that are highly targeted — at you, for specific reasons. Being vigilant means establishing threat awareness throughout the organization, and developing the capacity to detect patterns of behavior that may indicate, or even predict, compromise of critical assets.

Collecting terabytes of data, security operations centers can generate tens of thousands — sometimes literally millions — of alerts daily. Analysts are overloaded partly because detection is focused on infected machines, malicious IP addresses, or failed login attempts. Those details may be important, but without context, it is impossible to know if you’re seeing what really matters.

Yesterday’s relatively isolated malicious activity has given way to well-organized cyber crime enterprises and networks of politically motivated, and sometimes state-sponsored, attackers. They might steal data for financial gain, discover strategic plans for competitive advantage, or disrupt critical infrastructure to cause chaos or inflict economic damage. Relentless, sophisticated and patient, they stage attacks over time until they get what they’re after. Sometimes your employees or partners — wittingly or inadvertently — are accomplices.

Your efforts to be vigilant start with a solid picture of what you need to defend against. There are discernable threat trends across whole industry sectors. Knowing the landscape within your industry is an important starting point that needs to be supplemented by an understanding of your organization’s specific business risks. It’s a broad exercise to examine who could harm you, what motivates them, and how they’re likely to operate. By carefully plotting the motives and psychology of adversaries, and considering the potential for accidental damage by well-intentioned customers, partners or employees, cyber risk strategists anticipate what might occur and design detection systems accordingly.

This is a business challenge, not just a technical one. Executives need enough understanding of the threat landscape to provide cyber risk guidance. It is then the job of your technical teams to translate this into effective operational capabilities. And these capabilities must be continually adapted. Every innovation creates new possibilities that misuse or abuse will occur. And for every innovation, and every new control put in place, malicious actors will try to find the cracks and seep through them; you must adjust and preempt them.

**A closer look**

**Detecting persistent and targeted threats** requires broad organization-wide collaboration, and therefore strong governance.

First, because they require ongoing access to a very broad range of data — not just from IT devices and systems, but also business information as diverse as employee rosters, customer usage patterns, inventory records, financial records, and potentially data from non-traditional digital sources such as facial recognition systems, facilities access records, telephony records, industrial control systems and the list goes on. Second, the designers of these capabilities require deep engagement with business leaders to understand what “normal” activity and indicators of risk look like.

**A closer look**

**Malicious insider attacks** are not impulsive. Rather individuals move on a continuum from ideation to action, exhibiting certain behavioral indicators along the way. Insider acts often trigger potential risk indicators in three categories:

- Virtual actions, such as emails sent and databases accessed;
- Non-virtual actions, perhaps unexplained absences; and
- Contextual descriptors, such as user access and privileged rights.

Revealing at-risk employees requires correlation of data across these categories to connect the dots to discover relevant patterns over time.
If response to cyber incidents is viewed as primarily a technical function, you will likely not be equipped for decisive action.

Your technical teams handle many day-to-day, fairly routine security events. But some incidents may become serious business crises, which can affect your organization’s broader mission. Being resilient means having the capacity to rapidly contain the damage, and mobilize the diverse resources needed to minimize impact — including direct costs and business disruption, as well as reputation and brand damage.

If response to cyber incidents is viewed as primarily a technical function, you will likely not be equipped for decisive action on whether or not components of your operations should be taken off line, what to report to authorities, and how to collaborate with law enforcement. You may also be less nimble in resuming normal operations and less able to manage the perception of the public, and other stakeholders such as customers, investors, and regulators.

While resilience requires investment in traditional technology-based redundancy and disaster recovery capabilities, the bigger picture includes a complete set of crisis management capabilities. It involves IT, of course, but also various business and department leaders, and decision-makers from legal, risk, human relations, and communications functions. It requires a playbook across all these entities, designed in advance by considering how threat scenarios impacting critical assets and processes could play out.

Playbooks and policies must be written, but it’s equally important to rehearse them through cyber war-gaming and simulations that bring together business and technology teams. Staging simulations creates better organizational awareness and understanding of threats, improves cyber judgment, and plants the seeds of “muscle memory” that helps teams respond flexibly and instinctively to both the scenarios you envisioned, and the situations that couldn’t be foreseen.

Finally, incident response and crisis management must feed continuous improvement processes. Resilient organizations take the time to absorb important lessons, and modify the secure and vigilant aspects of the program to emerge stronger than before.

A closer look

Cyber war-gaming exercises reveal common issues that cause delays in responding as rapidly and effectively as a real crisis situation would warrant:

• Groups accustomed to operating in silos face challenges in coming to agreement on the relative severity of an incident, and therefore of the key actions needed.

• Roles and responsibilities, though they may be outlined in a process manual, are not well understood.

• Lack of awareness of law enforcement structures and legal process causes failure to capture valuable forensic evidence.
It won’t work without governance

A Secure.Vigilant.Resilient. cyber risk program is not just about spending money differently – it’s a fundamentally different approach.

Transforming from a traditional, standards-driven IT security program to a Secure.Vigilant.Resilient. cyber risk program is not just about spending money differently – it’s a fundamentally different approach — and your program will be unique to you. The balance of investment in secure, vigilant, and resilient capabilities will vary between organizations, and will even be applied differently to the various areas within your organization.

That said, Secure.Vigilant.Resilient. programs have some common characteristics:

• **They are executive-led.** Executive leaders must set the stage by defining cyber risk management priorities, risk appetite, and mechanisms of accountability. Sponsorship at the top is essential in rallying diverse groups and departments to collaborate in new ways.

• **They involve everyone.** Although specific roles need to be well-defined, the program is not the sole responsibility of a single part of the organization; it requires broad horizontal and vertical participation, and behavioral change throughout the enterprise.

• **They’re programs, not projects.** Although it usually requires a series of projects to get off the ground, Secure.Vigilant.Resilient. is an agile and adaptive program requiring continuous review and improvement cycles to adapt to changes in the business risk and threat landscapes.

• **They are comprehensive and integrated.** The secure, vigilant, and resilient elements are not distinct silos of activity; they’re a set of lenses through which every essential business process and growth initiative should be evaluated or planned. Each involves people, process and technology components. And done well, each will improve the others.

• **They reach beyond your walls.** Your ecosystem includes various partners, suppliers, and vendors; significant cyber incidents directly impacting them may also substantially affect you.

These transformations can’t take place without strong governance. Instituting a Secure.Vigilant.Resilient. program requires a carefully guided evolution — changes in roles, processes, accountability measures, well-articulated performance metrics, and most of all, an organization-wide shift in mindset.

**A closer look**

**It’s a living thing.** Any initiative where risk-sensitive areas of the business are enabled by digital assets should be considered through a secure, vigilant, resilient lens. Examples might include:

• A sales executive decides to empower the sales force and channel partners with mobile sales tools;

• A project team is charged with consolidating equipment and revising corporate network access for employees and contractors as part of a significant organizational realignment effort;

• A chief operations officer decides to invest in new RFID-based automation for manufacturing and inventory processes.
Where to begin will depend on where you are today, but if you determine that you’re early in a transformation process, the following steps can help you move in the right direction:

1) **Put a senior executive at the helm.** A cyber crisis situation requires a strong leader to drive cohesive, decisive action. But establishing the foundation requires someone with broad influence who can generate collaborative engagement among the diverse range of players essential to the success of the program — most of whom may be unaccustomed to thinking about cyber risk. The person in charge of the Secure.Vigilant.Resilient. program must be able to lead in both capacities, and be respected among a wide range of leaders, and at the board level.

2) **Map threats to the business assets that matter.** Create a high-level cyber risk guidance matrix by gathering top business leaders and threat intelligence specialists to preemptively discuss the potential threat actors and trusted insiders who could cause harm, the damage they could impose, and how they might do it. Through this threat-centric lens, identify significant areas of unaddressed cyber risks. Set your risk appetite and prioritize program areas that embody your strategy for becoming secure, vigilant, and resilient.

3) **Launch priority projects for early “wins.”** Establish momentum by focusing on several areas or pilot initiatives that directly impact business success or mission achievement, with objectives that can be measured, and with built-in continuous improvement processes. By maintaining focus and demonstrating results, you can plant the seeds of a Secure.Vigilant.Resilient. culture that has a long-term, sustainable impact.

4) **Accelerate behavioral change through incentives and experience-based awareness.** Traditional security training is an important program component, but on its own is not enough, as evidenced by the number of breaches that can be traced back to stolen laptops, weak passwords, or failure to follow secure application development protocols. In a typically busy and stressful work environment, a policy manual alone will not prepare people to take the right action. Therefore, create some active learning scenarios that deepen understanding of the impact of day-to-day activity on the organization’s cyber risk posture, and identify visible opportunities to reinforce the right behavior through programs that reward speaking up, raising questions, and achieving core Secure.Vigilant.Resilient. program objectives.

Becoming secure, vigilant, and resilient requires that the organization embrace a fundamentally different view of what we’ve previously called “security.” Yesterday’s security program was often perceived as a burden – an externally-imposed set of restrictions, rules, and procedural hurdles that impeded business initiatives. Security rigor has been pitted against progress, striking up battles over the budgets and timelines of strategic initiatives. Depending on which prevailed at any given point, the net result has too often been either recklessly risky innovation, or a degree of caution that leads to lost opportunities.

In the pace of today’s climate, organizations cannot afford to slow innovation simply because it cannot be perfectly secured. But neither can they innovate without appropriate regard for the inherent risks being generated. Cyber risk and innovation are inextricably linked; rather than subordinating one to the other, senior executives must harmonize these important elements of business performance through a program to become secure, vigilant, and resilient.
