

Time consuming

Finding data points in long documents is time consuming. Experts are wasting time browsing and searching instead of what they are trained for

Always urgent

New regulations and mandatory regulatory remediation efforts require you to go back to documents to obtain additional information

Mind numbing work

Document review and data point retrieval often require involvement of experts even though this is a mind-numbing task. Typically 60-80% of the work is simple and repetitive and only exceptions require time of experts

Data quality challenges

Manually sifting through thousands of documents is error prone. And once you've got the data it is still difficult to prove data is reliable and can be trusted

Different formats & languages

International companies must deal with many different types of documents making it hard to standardize. Multiple languages makes it even harder to organize your workforce effectively

Expensive

Large volumes require you to mobilize a large workforce and support organization. How can you minimize cost and still benefit from all the insight locked away in these documents?
