Executive summary

Growth in the global aerospace and defense (A&D) sector, as in other manufacturing sectors, is often dependent on global economic growth. The current subdued global economy has made it an uphill task for many manufacturers to achieve strong growth. Manufacturers, including those in the A&D sector, that can differentiate themselves by offering competitive products at competitive prices are the ones that will likely stand out. What makes these companies excel? How are these companies able to outperform the market? The answers may lie in their intense focus on certain competitive capabilities.

To understand which capabilities companies are focusing on, Deloitte Touche Tohmatsu Limited, along with the Council on Competitiveness, conducted a study where we asked global executives about the capabilities they believe are important for current competitiveness and how important these capabilities are going to be for the future. These capabilities are typically transient by nature and companies will likely have to be constantly vigilant to identify and invest in capabilities that will help them be differentiated leaders in the market. To improve their competitiveness, companies in the A&D sector are focusing on:

**Building a skilled workforce base and retaining talented employees.** Talent is a key competitive capability for manufacturing organizations. A skilled workforce is required throughout the organization, starting from the boardroom to shop floor. Talented employees help companies carry out the critical research and development (R&D) needed to bring innovative products to the market. In addition, a skilled workforce is required to work with the advanced technologies that A&D companies are investing in to develop new products, improve existing products, and provide an enhanced aftermarket experience. To carry out the critical R&D required, as well as to work on smart machines, A&D companies can tap into different sources, such as working with high schools to attract young talent, recruiting women who often constitute a large untapped demographic, and investing in continually training their employees.

**Investing in cybersecurity and protecting intellectual property (IP).** Deployment of digital advanced manufacturing technologies carries new risks associated with the unauthorized access to systems. As regulations concerning protection of patents, copyrights, trademarks, or other intellectual property are not strong in all countries, there are chances of imitation products being developed. Building cyber risk management strategies along with constant monitoring of the sources of cyber risks, and being prepared for vulnerabilities, can help A&D companies build defenses against cyber theft and protect their intellectual rights.

**Leveraging Industry 4.0.** Investing in and implementing new manufacturing models, such as Industry 4.0 or smart manufacturing that integrate the physical world with the digital world, can aid in higher productivity, lower risk, and additional revenue. Many A&D companies are using advanced technologies such as Industry 4.0 to not only develop new products in a cost-effective way but to also improve existing products by leveraging data generated in the smart manufacturing production process. Leveraging advanced technologies to introduce new and differentiated products and services in the marketplace will help A&D companies grow both their top and bottom lines as these products and services typically carry higher margin. Moreover, advanced technology investments can provide disproportionate benefits in technology-intensive sectors such as A&D, as it will be difficult to easily mimic products and services.
The aftermath of the 2008–2009 financial crisis has created many challenges. Despite the large-scale quantitative easing carried out by major central banks and fiscal stimuli offered by governments, global economic growth has yet to regain its strength. Though the global economy is likely to grow at 2.7 percent in 2017 compared to 2.4 percent in 2016, concerns remain around protectionist policies espoused by governments, which are likely leading to slowing global trade, uncertainties surrounding global value chain integration, and increased trade policy uncertainty.¹

In these uncertain times, it is often increasingly difficult for manufacturing companies to generate sustainable growth. And the A&D sector is no exception. Global A&D sector revenue grew 2.4 percent in 2016 and likely will post 2.0 percent growth in 2017, lower than the average 3.1 percent growth posted over the period 2010–2015.² Growth is expected to be particularly slower in the commercial aerospace subsector at 0.3 percent, compared to the defense subsector which will likely post growth of 3.2 percent, mainly driven by defense spending in the United States.³

Of the companies that comprise the A&D sector, high performers have executed better on financial metrics, such as profitability margins, return on assets, return on invested capital, free cash margin, and other parameters. This study aims to identify the probable reasons for improving competitiveness and becoming a high performer. What are the capabilities that help an A&D company become a high performer and generate superior returns? What capabilities do A&D companies think are important in maintaining their current competitiveness and what capabilities do they think are needed for the future?

High performers reported stronger financial metrics than other A&D companies over the last five years. To understand the importance of being a high performer, Deloitte conducted an analysis of pure-play A&D companies, or companies with A&D as their major business (more than 75 percent of revenues from A&D), and with 2016 revenue greater than $2 billion.

We calculated an overall score for each company based on the five-year average of five equally weighted financial performance metrics that place significant emphasis on operational excellence: revenue growth, operating income growth, operating margin, free cash margin, and return on invested capital (ROIC). We normalized the overall score to convert the values in the range of 0 to 1. Based on the normalized score, we ranked the companies in descending order and identified the top quartile as well as bottom quartile companies in the A&D sector.

As seen in figure 1, top quartile A&D firms grew much faster. Their profitability and free cash margins are double that of bottom quartile firms, and their returns on invested capital are more than three times that of bottom quartile A&D firms.

---

**Figure 1. Financial performance of the top quartile versus bottom quartile A&D firms (2012–2016)**

Framework for analyzing high performers

To better understand the specific capabilities that high-performing manufacturing companies are focusing on, the study asked more than 500 CEOs to rate their company’s current competitiveness relative to their closest global rivals on 35 specific capabilities (refer to methodology section at the end of the paper to learn more about the executive study). They were also asked to rate how important they thought each capability is relative to future competitiveness. These ratings were then normalized, converted into a 10–100 scale, and positioned on a scatterplot. This helped conceptualize a framework with two principal elements:

1. The positioning of 35 specific capabilities along two dimensions of (a) how competitive an organization is today with regard to the capability; and (b) how important the organization believes that capability is to their future competitiveness (figure 2).

2. Identifying the capabilities high-performing companies are focusing on to improve their performance in the future.

Given the limitations of a small sample of A&D companies, we plotted the average scores of all A&D companies to identify the competitiveness capabilities A&D companies are focusing on now and in the future. Note, this is a slightly different methodology used than in the broader High-performing manufacturers study.

Figure 2. Framework for analyzing high performance

Source: Deloitte Insights, High-performing manufacturers study
The scores of A&D companies were plotted on a scatterplot with current competitiveness shown on the x-axis and future importance on the y-axis (figure 3). The capabilities that are at the top and above the diagonal line are the ones on which high performers intend to place higher importance in order to differentiate themselves from other companies in the future.

**Figure 3. Competitiveness map for A&D companies**

What are the focus areas for A&D companies to become high performers?

Identifying the key capabilities that A&D companies are focusing on can help us understand their priorities for being competitive now and how they plan to remain competitive in the future. Figure 4 illustrates the certain capabilities A&D companies are focusing on relative to current and future competitiveness.

Figure 4. A&D companies focus on key competitive capabilities

Source: Deloitte analysis based on company-level data from Deloitte Touche Tohmatsu Ltd. and Council on Competitiveness, 2016 GMCI study
Availability of skilled talent is key

Many manufacturers, including those in the A&D sector, consider talent-related capabilities to be very important for their company’s current and future competitiveness. Not only for company competitiveness, but also for a nation to be globally competitive, talent is considered to be the most important capability. The global study conducted by Deloitte and the Council on Competitiveness found that manufacturing executives worldwide ranked “talent” as the most important driver of country-level manufacturing competitiveness.

A&D companies recognize the increasing need for a skilled and talented workforce in the face of an evolving manufacturing and technology landscape. In fact, A&D companies have assigned a rating that is close to 100 to skilled workforce availability for future importance.

For the entire manufacturing industry, talent will be a key competitive lever going forward as the skills gap issue becomes increasingly pervasive. As many as two million manufacturing jobs in the United States are likely to go unfilled between 2015 and 2025 due to the unavailability of skilled workers. However, concerned with the challenges posed by the skills gap and the difficulty of attracting new, top talent, many A&D companies are placing relatively high emphasis on employee retention now and for the future. In addition to skills and talent, high-performing A&D companies are assigning high future importance to leadership capabilities, such as leadership and management and leadership succession.

In 2015, Boeing started targeting high school talent through an accelerated hiring and training program to fill future workforce gaps. The original equipment manufacturer (OEM) focused on partnerships with academic institutions to help ensure that school curriculums match the skill set required by the company. Boeing has had partnerships with nearly 30 high schools, skill centers, and technical colleges, specializing in specific areas.
What makes high performing A&D companies tick? | Capabilities that can bolster competitiveness

Leadership to steer the company
In a highly complex, globally developed sector, strength and stability in leadership help in overseeing the development of new products that take years to develop, and in successfully executing long-gestation projects that are typical to the A&D sector. These long lead times may be the reason why A&D companies have assigned higher scores on leadership and management and leadership succession capabilities, for both current competitiveness and future importance, particularly for the future.

Advanced technologies to drive growth

United Technologies’ leadership steered the game-changing Geared Turbofan (GTF) engine project. It proved to be disruptive, as it helped OEMs launch new-generation aircraft at least a decade earlier than planned. The company’s success was possible due to the company leadership's vision to develop a revolutionary engine that would improve fuel efficiency as well as reduce emissions and noise.9

Among the different manufacturing sectors, A&D is one that has pioneered many innovations that have found applications in other sectors of manufacturing, as well as in other industries. Commercial aircraft, human spaceflight, the Internet, global positioning system (GPS) navigation, and satellites are a few examples of game-changing technology innovations that are applied extensively across industries.10 Leadership in the use of advanced technologies continues even today with the sector being at the forefront of digital innovations, helping lead the way for adoption of such technologies as additive manufacturing, machine learning, advanced analytics, smart automation, and blockchain, among others. A&D companies have assigned the highest possible rating of 100 to the use of advanced technologies on future importance. Many A&D companies are now using advanced technologies for a range of products, from complex engine parts and wing components to relatively simple, yet customized parts such as armrests and food trays.

A&D companies are using advanced technologies to develop completely new cost-effective products and services, making existing products smarter by adding sensors and connectivity and better by using advanced materials. For instance, real-time flight data collected from sensors in aircraft are used to reduce fuel consumption, improve scheduling, and minimize flight delays. In addition to design, development, and manufacturing of products, advanced technologies also can help improve the aftermarket experience by using data to track asset condition and predicting the chances of parts and systems failures beforehand.11

GE Aviation collects real-time data from internet-connected systems on aircrafts and runs advanced analytics to identify faults in their engines, thus helping to lower maintenance costs and extend the life of the parts that go into the aircrafts. Maintenance crews can determine when to replace a component before it malfunctions, avoiding costly unscheduled downtime.12
Raytheon, a US-based defense contractor, has invested more than $3.5 billion in cybersecurity initiatives over the last 10 years. The company expects to further increase investments in cybersecurity-related R&D and acquisitions, as combating cyber threats is becoming a priority for Raytheon’s customers, including the US Department of Defense. Since 2007, Raytheon has made 17 cyber-related acquisitions, and it continues to scout for more, according to the chief technology officer of the company’s cybersecurity and special missions division.13

Cybersecurity and IP protection to help ensure safety of critical tangible and intangible assets
As A&D companies continue to invest in advanced technologies to develop new products and make existing products smarter, they are looking to protect their connected manufacturing systems and processes from cyberattacks. In addition, they are also concerned about other companies copying or reengineering their products, technology, or intangible assets like intellectual property. To protect their manufacturing assets that are now digital and intellectual property, A&D companies are focusing on cybersecurity and IP protection. Cybersecurity deals with the techniques of protecting computer systems, networks, programs, and data from unauthorized access, while IP protection is related to protecting patents, trademarks, copyrights, and trade secrets.

Many manufacturing executives think cybersecurity is the largest information technology (IT) risk. In addition, the number of times the word “cybersecurity” appeared as a key risk factor in 10-K SEC filings increased from 74 in 2011 to 339 in 2015, and that number is likely to be surpassed in 2016 (by June 2016, the number of citations was already 327).14 Many companies, including those in A&D, understand the importance of cybersecurity and are focusing on cyber risk strategies to differentiate their performance.

More than a third of manufacturers mentioned that “theft of intellectual property” is the top cyber risk they face.15 By 2020, businesses are likely to spend more than $100 billion on cybersecurity software, services, and hardware.16 A&D companies, think that this capability is a must-have for their future competitiveness. Many defense companies that rely on government orders for their revenue are making serious efforts to protect their assets from cyber threats. Several governments affected by terrorism threats have increased their spending on addressing security matters, including cybersecurity measures. As part of those efforts, many governments are interested in procuring cyber protection and services equipment.17
Bringing products quickly to market and catering to a global customer base

A&D companies are placing higher future importance on global sales and marketing and speed of new products to market to enhance their future competitiveness. To grow their business, A&D companies are developing products that carry higher margin, investing in new services, and focusing on new customers and markets.\(^19\)

As the markets in developed economies have matured, many A&D companies are targeting emerging economies as the new growth drivers. For instance, the share of military expenditure from the Asia and Oceania region rose to 26.8 percent in 2016 from 20.3 percent in 2010, while that of the Americas declined to 41.3 percent from 49.8 percent during this period. Hence, many global defense companies are increasing their footprints in regions such as India, China, and the Middle East.\(^20\) The A&D supply chain is currently undergoing transformation with on-time delivery being one of the primary objectives. Many A&D companies are leveraging their supplier network strength as research shows supplier relationships can play a major role in product development. These relationships could be of great significance when there is high technological complexity involved. In addition, involving major suppliers early in the product development process can build trust among all players and diversify the risk associated with new product development.\(^21\)

In the development of its A380 aircraft, Airbus collaborated with multiple suppliers early in the aircraft development process and widened its supplier base globally instead of sourcing mainly from Europe. Airbus also entered into risk and reward sharing partnerships with its key strategic suppliers.\(^18\)
Focus on risk management
The A&D sector is prone to program management issues, ranging from technical delivery issues and changing government regulations to delays in government budgets. The results can be cost escalation that makes program management a challenge. To address the program management issues, A&D companies need to identify the root causes and address the problems to bolster their top and bottom lines of growth.

Providing higher value for price
A&D companies are focusing on higher value for price and total delivered cost to improve profitability margins. As governments in major markets, such as the United States, are exerting pressure on defense companies to limit costs, execute projects on time, and deliver more value for the price they are paying, defense companies have focused on cost reduction to protect their margins. At the same time, A&D companies are focusing on managing total delivered cost and labor costs to boost operating profit margin. As part of those efforts, some aircraft manufacturers are restructuring their businesses, which includes eliminating duplication of functions between parent company and subsidiaries, reducing inventory costs, adjusting payment terms with suppliers, and investing in productivity to reduce labor costs.\(^\text{22}\)

Lockheed Martin has been focused on cost reduction to become more efficient and competitive. In October 2015, it announced a cost-cutting review to reduce costs by 30 percent. By the end of 2016, the company’s core operating margin improved by 80 basis points to 11.9 percent from 11.1 percent in 2015, which is higher than the average industry operating margin of 10.4 percent in 2016.\(^\text{23}\)
How can A&D companies improve their manufacturing competitiveness?

Globally, the A&D sector is likely to grow 2.0 percent in 2017 with higher production requirements for both aircraft and defense equipment.²⁴ However, the sector is likely to experience pricing pressure as customers, whether airlines or government defense procurement officials, continue to expect more value for the dollar, forcing A&D companies to be more efficient and cut costs wherever possible.²⁵ In these uncertain times, it can become much more important for A&D companies to quickly address any challenges they are facing and, at the same time, invest in new technologies that can help them cater to changing customer needs. A&D companies can improve their current as well as future competitiveness by focusing on human capital requirements, protecting intangible assets like intellectual property, and being at the forefront of adoption of new manufacturing technologies.

To further understand the evolving human capital trends, in 2017 Deloitte conducted a survey of more than 10,000 business and human resource leaders, including 49 leaders from A&D. Based on the responses from the A&D leaders, the workforce implications for various business issues are provided in figure 5. The top workforce priorities for businesses in A&D include investing in people development, improving productivity of their workforce, preparing employees to understand changing customer requirements, and retraining people to use digital tools as work becomes more automated.²⁶

Invest in talent. Manufacturing, including the A&D sector, is suffering from a shortage of skilled workers which can negatively impact new product development and make meeting production targets that much more difficult. At the same time, manufacturing, including the A&D sector, is on the path toward deployment of smart machines in their manufacturing processes. To work with these machines, the workforce needs to be highly skilled.²⁷

For companies in the A&D sector to remain competitive, they should consider not only hiring top talent but also retaining them. To improve their talent base, A&D companies should consider:

- Attracting young talent by engaging with local high schools and elementary schools to build interest in STEM skills.²⁸
- Women in manufacturing are typically one of the largest pools of untapped talent. Though women formed 46 percent of the US labor force in 2016, they constituted just 29 percent of the US manufacturing workforce.²⁹
- Investing in education. More than 90 percent of manufacturing executives agreed that “internal employee training and development programs” are the most effective in addressing the talent shortage among the workforce.³⁰

Source: Deloitte, 2017 Human capital trends—A&D sector outlook
Make business secure, vigilant, and resilient. Manufacturing companies, including those in the A&D sector, are increasingly investing in digital technologies and advanced data analytics to hasten product development, improve existing processes, and serve customers better. As the manufacturing value chain has been globalized and cuts across geographies, companies in the manufacturing industry are often exposed to threats from cyber-attacks and theft of intellectual property. In fact, only half of the manufacturing executives surveyed as part of Deloitte and MAPI’s Cyber risk in advanced manufacturing study were either very confident or extremely confident of their organizations’ assets being protected from cyber threats.³¹

Manufacturing companies, including those in the A&D sector, need to be secure, vigilant, and resilient (figure 6). As part of those efforts, they can:

- **Be secure**
  - Take a top down, risk-based approach to implementing security strategies for the most critical networks, systems, and data.

- **Be vigilant**
  - Implement routine monitoring mechanisms for high risk networks, systems, and data that will alert the company to abnormal activity and enable prompt action.

- **Be resilient**
  - Plan ahead before a breach occurs so the entire organization is prepared to respond in order to quickly neutralize threats, prevent further spread, and recover from business impacts.

Figure 6. Cyber risk framework

![Figure 6. Cyber risk framework](image-url)
**Embrace Industry 4.0.** A&D companies, like other manufacturing companies, can improve their business by focusing on improving productivity, reducing risk, and generating incremental as well as new revenue. These objectives can be achieved either through the traditional manufacturing model of a linear value chain or by dynamic processes. For this, companies should integrate their information technology with operations technology to aid in physical-to-digital-to-physical connection—a state commonly referred to as Industry 4.0 or smart manufacturing.

To better understand where value is created by Industry 4.0, Deloitte has developed an information value loop that shows the flow of information through the five value-creating activities (figure 7). Industry 4.0, plays a role in the “act” and “create” stages or in the physical-to-digital and digital-to-physical leaps that are unique to manufacturing processes. The value of Industry 4.0 can be felt particularly in the digital-to-physical phase—from connected, digital technologies to the creation of a physical object. To learn more, please refer to the Deloitte Insights study “Industry 4.0 and manufacturing ecosystems.”

**Figure 7. The information value loop**

Industry 4.0 can help manufacturers, including those in the A&D sector, make new products in new ways. It can also completely change the existing supply chain, production, and business models. A&D companies can benefit from the application of Industry 4.0 by:

- Making already existing products smarter by adding sensors and connectivity and by adding advanced materials to improve performance.
- Offering the data generated from smart technologies as a product or service.
- Developing entirely new products or services by leveraging advanced manufacturing technologies.

What makes high performing A&D companies tick? | Capabilities that can bolster competitiveness

Conclusion

To become high performers, A&D companies need to focus on the right set of capabilities that help them maintain their current competitiveness and drive their performance into the future. High-performing companies, be it in A&D or in overall manufacturing, garner substantial share of the market and typically have better profitability through their superior products and exceptional service. However, the journey toward becoming a high performer is fraught with multiple challenges. Companies not only need to identify but also invest in the right capabilities to transform themselves into a high performer.

To remain competitive now and in the future, A&D companies are focusing on capabilities related to:

- Skilled talent to bring innovative products to market and to operate smart machines
- Advanced technologies to develop new ways of manufacturing products
- Smart manufacturing to improve existing products and develop new products as well as processes
- Protecting intellectual assets

A&D companies that strive to protect their competitive position by being flexible to transform themselves to suit changing market conditions will emerge as the high performers.
Methodology

As part of Deloitte’s ongoing collaboration with the Council on Competitiveness on the Global Competitiveness in Manufacturing Initiative, we conducted a global study of manufacturing CEOs in 2010, 2013, and 2016. Together, these studies received more than 1,600 CEO responses.

On a broad list of capabilities, we asked CEOs to rate their company’s current competitiveness in each capability relative to their closest global rivals, as well as rate how important they thought each capability would be to staying competitive in the future. In order to remove the variations in rating among countries (due to culture), industry subsectors, and company revenue sizes, we normalized the data by country, industry, and size, and calculated current and future index scores for each of the capabilities on a 10–100 scale for both current competitiveness and future importance.

In the High-performing manufacturers study, we separated the respondents’ companies into “high performers” and “other companies” (all other companies studied). High performers were identified on the basis of four parameters: the company’s actual profitability, its profitability when compared to its peers, whether the company met or exceeded its profitability goals, and the company’s performance on return on assets.

For this derivative study, we have not categorized A&D companies into “high performers” and “other companies” as the sample size is limited to 19. Instead, we calculated the average scores on current competitiveness and future importance for the broad list of capabilities of all the 19 A&D companies that participated in the study.

Please read the Deloitte insights study on high-performing manufacturers to learn more.
