

Deloitte.

Crunch time V
Finance 2025

(Our predictions)

Hold on

From phone apps to home automation to cashless commerce and beyond, digital disruption is the new normal for consumers today. It's changing what we do – and how we get things done – in countless ways.

In business, robots are working alongside human beings to build cars, deliver packages, design computers, and make electricity. Blockchain is tracking supplies of diamonds and monitoring construction equipment. And smart machines are taking up residence in hospitals, shipping containers, drug stores, and more.

What does this have to do with the future of Finance? Everything.

Over the next seven years, these same technologies will be coming to your organisation with the promise of making Finance better, faster, and probably less expensive. The work we do and how we do it is up for grabs.

So far, no organisation we know of has put it all together. Not in Finance. Not yet.

But you can see it coming.

Where things stand *today*

While a number of leading finance organisations are using pilots to experiment with new technologies, we aren't yet seeing evidence of scalable, transformational change. The roadmaps to that future are still being drawn.

The good news? The technologies needed to reimagine the Finance team is here and will only get better. Plus, we can learn a lot from other business functions. Modern factories give us a glimpse of what automation can deliver. Smart contracts show us new ways of tracking assets. The lessons are out there. We don't have to reinvent the wheel. We can focus instead on adapting and adopting.

Here's the bottom line. The business leaders that Finance supports are people first. They see how technology is making their personal lives better and easier. That's what they want for Finance, too.

The needs of the business are growing. The pace of innovation is accelerating. CFOs can either plan for change, or plan to retire.

Finance  2025

Our predictions

The finance factory	6
The role of Finance	8
Finance cycles	10
Self-service	12
Operating models	14
Enterprise resource planning	16
Data	18
Workforce and workplace	20

Our predictions

When it comes to the field of Finance, we consider it our job to anticipate how organisations will evolve. The methodology for generating our predictions is straightforward. We look carefully at what finance leaders are doing and at the technology that's available, and then we ask these questions: What would be possible if we combined different technologies to reimagine the future? How would the work of Finance get done and who would do it? How could Finance contribute even more to the success of the company? With these questions in mind, here's the future we see.

1. The finance factory

Transactions will be touchless as automation and blockchain reach deeper into finance operations.

2. The role of Finance

With operations largely automated, Finance will double down on business insights and service. Success is not assured. The skills required by finance professionals will change, likely dramatically, as new combinations of technology and human workforces permeate the workplace.

3. Finance cycles

Finance goes real time. Periodic reporting will no longer drive operations and decisions – if it ever did.

4. Self-service

Self-service will become the norm. Finance will be uneasy about this.

5. Operating models

New service-delivery models will emerge as robots and algorithms join a more diverse finance workforce – think about the integration of freelancers, gig workers, and crowds. Companies will assess the benefits of automation against onshore and offshore operations.

6. Enterprise resource planning

Finance applications and microservices challenge traditional ERP. Big vendors will be prepared.

7. Data

The proliferation of APIs will drive data standardisation, but it won't be enough. Companies will still be struggling to clean up their data messes.

8. Workforce and workplace

Employees will be doing new things in new ways, some of which will make CFOs uncomfortable.

The finance factory

Transactions will be touchless as automation and blockchain reach deeper into finance operations.

In the years ahead, cloud-based ERP, automation, and cognitive innovation will continue apace, creating opportunities to radically simplify processes and free up people. Adding blockchain to the mix will only accelerate this trend. As this transition picks up speed, the capacity of humans to add value will be unleashed.

Work

Traditional processes – and the silos around them – will disappear as the focus of Finance shifts to design, configuration, and maintenance of systems. Finance will excel in translating business practices and governance models into automated processes. Real-time metrics and monitoring will be indispensable.

Workforce

As the workforce is augmented by robots and cognitive agents, Finance will need humans who can build and connect systems that interact with other systems. Some will be traditional employees, and others may be contractors or freelancers. In either case, there will be a premium on talent that understands technology and business. These professionals are already in short supply. The shift to a hybrid workforce, including new combinations of on- and off-balance sheet workers, will grow.

Workplace

The workforce in Finance will change; its reach into the business will expand. Leading organisations will implement finance command centres, where small groups of professionals can monitor the full array of processes using smart dashboards. Chatbots and voice integration will go mainstream, giving stakeholders the benefit of seamless, intuitive interactions with technology and data. One result will be new levels of agility, especially for supporting M&A and divestment activities.

Takeaway

Some find it interesting to speculate about Finance disappearing under the crush of digital disruption, but we don't see that happening. Yes, Finance will likely be leaner, but that will mostly be a function of headcount in Operational Finance (order-to-cash, procure-to-pay, transactional accounting, etc.). Meanwhile, expectations for support from Business Finance (business partnering, reporting, planning, budgeting, forecasting, etc.) and Specialised Finance (tax, treasury, IR, etc.) will continue to grow.

What to do

- Assign a team to learn how other finance organisations are piloting digital tools and automating processes. The technologies that will matter in 2025 are already being looked at somewhere. Find out who's doing what.
- Examine one of your most labour-intensive processes and imagine eliminating it through automation and cognitive tools. How would that kind of change impact your organisation and talent needs? Visit one or two automated factories for inspiration.

There will be a premium on talent that understands technology and business. These professionals are already in short supply.

The role of Finance

With operations automated, Finance will double down on business insights and service. Success is not assured.

Whether Finance continues to direct the resources currently under its control will be dependent on its ability to add value. That will require quality insights and exceptional customer service. Some finance organisations will evolve into full-fledged business service centers.

Work

Business partnering will shift upstream from budgeting and reporting to include scenario planning, advanced forecasting, and better visualisation. Teams of business partners will come together to focus on the most complex commercial decisions, moving around the business as needed. Information required to make decisions will appear “just in time,” fully integrated into overall management processes. Routine forecasts will be handled by algorithms that are constantly evaluated by small resource pools including data scientists, story-tellers, and cognitive psychologists. Finance will have a bigger say in how decisions get made throughout the enterprise.

Workforce

Computers will handle routine requests from business leaders, giving Finance the opportunity to be more proactive. People will spend less time preparing data for analysis, and more time asking “What does this tell me about the business?” and “How can the business close gaps in performance expectations?” Answering these questions requires an understanding of financing and capital, and being able to advise on resource deployment. This is a big shift from how many in Business Finance operate today.

Workplace

Agility will become a prized quality as finance organisations have to deliver differentiated service levels to different parts of the business. For high-performing units, a finance business partner might co-locate and join the business’s leadership team. Under-performers might also get hands-on support, but for remedial purposes. Combinations of people and technology will be the glue that keeps teams connected.

Takeaway

Companies know that sharing knowledge across disciplines is a good thing, even if it creates headaches. Learn what it takes to make the most of blurring boundaries.

What to do

- Identify your best business partners and clone them. Ask them to help train less experienced people, and hold them up as examples of what you're looking for.
- Envision a decision-rights role for Finance. Create a taxonomy of decisions to help your organisation understand the how and when of business decision-making.

Routine forecasts will be handled by algorithms that are constantly evaluated by small resource pools including data scientists, story-tellers and cognitive psychologists.

Finance cycles

Finance goes real time. Periodic reporting will no longer drive operations and decisions – if it ever did.

When both actuals and forecasts can be produced instantly on demand, traditional cycles become less relevant. The old distinction between operational and analytical data begins to disappear. Finance organisations will still need to meet external demands for cyclical information, but outside investors may also want more frequent performance information. Leading organisations will be operating with a new mantra: There is no close. You're not forecasting once a month or quarterly. It's all happening in real time.

Work

Stakeholder expectations for information and insights will increase dramatically. Continuous tracking of sales, cash flow, inventories, and more will be the norm. Information quality will be overseen by people monitoring machines that do the work.

Workforce

Finance will place big bets on data scientists and design professionals who can engineer automated reporting, forecasting, and end-to-end processes. The mix of talent will challenge old-school leaders. These new employees will be working alongside traditional business analysts to deliver real-time information and insights to finance customers. Augmented by artificial intelligence, they'll provide deep learning and pattern recognition that extend the capabilities of humans alone.

Workplace

Finance organisations will be flatter and more distributed, with agile teams taking advantage of instant and easy access to data, no matter where or how it's generated. Batch processing will become a term that triggers nostalgia for a bygone era. Systems will deliver streaming data with no latency. Seamless, touchless, integrated information platforms make it all possible.

Takeaway

Many finance cycles today are driven by technology and data-processing limitations. Things happen on a regular schedule because that's the only way they can happen. When information becomes available instantly to those who need it, traditional cycles become unnecessary. That frees people to focus on discovering new insights and acting on them.

What to do

- Which of your most important decisions are driven by the calendar? Rethink how and whether those decisions might be made in a real-time operating environment.
- Develop a list of use cases to take advantage of real-time automation.

You're not forecasting once a month or quarterly. It's all happening in real time.

Self-service

Self-service will become the norm. Finance will be uneasy about this.

There are plenty of business people who don't need hand-holding when it comes to basic finance. If they could get their questions answered by a digital voice on their smart phones, they'd be happy to do so. Activities ranging from budget queries to report production and more will be automated. Over time, smart agents will learn what kinds of business information an individual needs, and deliver that information proactively. As that future unfolds, data in spreadsheets will be replaced by visually rich information that is intuitively accessible and easy to use.

Work

Accountants using spreadsheets will be replaced by technology that does 90% of the work without human intervention. Higher-value work requires cross-functional collaboration among business people, technology teams, and finance strategists.

Workforce

It won't be possible to buy all the talent needed to answer all the routine questions business leaders have. Companies that want to thrive in the brave new world will cultivate the skill sets necessary for a self-service culture. Make sure you're accessing and developing people who understand the importance of great customer experiences.

Workplace

Security is always important, but it takes on new urgency in a self-service world. The data lakes that Finance oversees will be exposed to whole new sets of business users. Chatbots will become the primary mechanism by which people interact with technology and data.

Takeaway

With growing expectations for responsiveness and quality from Finance, getting self-service right is paramount. When your customers have to take care of themselves, the last thing Finance needs is for them to be frustrated or unhappy.

What to do

- Observe how you're using self-service tools in your personal life as a consumer. What would it look like if you could bring those tools into your professional life?
- Ask your business counterparts about their readiness to take control of their own analytics, reporting, and forecasting needs.

Over time, smart agents will learn what kinds of business information an individual needs, and deliver that information proactively.

Operating model

New service-delivery models will emerge as robots and algorithms join a more diverse finance workforce; think about the integration of freelancers, gig workers, and crowds. Companies will assess the benefits of automation against onshore and offshore operations.

Automation provides a new lever for managing costs, one that gives finance organisations the opportunity to reevaluate how they're organised, where work gets done, and what kinds of processes no longer require human intervention. Finance-as-a-service will gain traction beyond mid-market companies.

Work

People will do more human work including exception-based and insight driven activities – work that is investigative in nature – as organizations realise the potential of automation and blockchain. Gone are the days of copying and pasting special values from a contract, invoice, or other document into an ERP system. Leading finance organisations are designing automation tools to do this work.

Workforce

Finance operations will depend on growing collaboration among Finance, IT, and the business. Many organisations will turn to Centres of Innovation to foster understanding and communication across disciplines. Teams will include experts in robotics, blockchain, and cognitive technologies, with diverse talent models that leverage portfolios of freelance, gig, and crowd workers. They'll move from project to project, embedding capabilities across the enterprise, creating more integration, and eliminating silos. Those open to learning and development will see the most opportunity for professional and personal growth.

Workplace

Members of cross-functional teams will grow by learning from each other. New leadership and teaming models, focused on intense levels of collaboration, will grow. They'll tackle problems and challenges too complex to be addressed by any individual or group with the same skill set. The finance workplace will need to enable and facilitate collaboration across a broad range of interdisciplinary teams. Easy-to-use collaboration technology is critical.

Takeaway

Companies may see significant disruption in the offshoring and outsourcing space, with individual suppliers and their capabilities looking quite different than they do today. At the same time, the need to build dynamic, cross-functional teams will strain finance organisations that aren't preparing now for what's ahead. As with all changes, good leaders will be essential for navigating these transitions.

What to do

- Meet with your outsourcing providers. Ask them to share their strategies for automation, cognitive, and blockchain over the next seven years. Identify how productivity improvements will be shared. Insist on being dealt into the game on automation upside.
- Use scenario planning to figure out how technology will affect choices about what work should be done where and by whom.

Finance-as-a-service will gain traction beyond mid-market companies.

Enterprise resource planning

Finance applications and microservices will challenge traditional ERP. Big vendors will be prepared.

ERP vendors are already building digital technologies like automation, blockchain, and cognitive tools into their products, but that won't forestall competition. Look for the landscape to shift as new players enter the ERP space with specialised applications and microservices that sit on top of – and integrate with – ERP platforms. Cloud-based ERP will help ensure that you're constantly updated on the latest release.

Work

As more companies move to cloud-based ERP, they're choosing to become more standardised – with their systems operating like smart phones that download updates overnight. Instead of building customised systems, companies will buy what they need from the growing marketplace of apps and microservices. The work of Finance will be about understanding how these new services work together to streamline processes and deliver insights.

Workforce

The days of “human middleware” are coming to an end. Technology is getting smarter – integrating itself into ERP platforms without needing people to intervene. Instead of “being the app,” your people will be focused on “using the app” to give business leaders the information they need to make smarter, faster decisions.

Workplace

Companies invested heavily in custom applications will face the increasingly high cost of complexity. Not only does complexity drive the need for continuous training and development, it also demands specialised talent.

Takeaway

Finance is entering a golden age of technology. As cloud becomes the norm for ERP, finance applications and microservices will proliferate. You'll be able to drastically reduce the complexity and cost of technology, without sacrificing functionality.

What to do

- With the recent push to the cloud, ERP vendors are steadily adding new capabilities and services to their product portfolios. Ask your IT team for a briefing about what's already possible from your ERP provider, as well as what's on the near-term horizon.
- If you've not done so already, start creating your own roadmap to cloud for Finance.

Cloud-based ERP will help ensure that you're constantly updated on the latest release.

Data

The proliferation of APIs will drive data standardisation, but it won't be enough. Many companies will still struggle to clean up their data messes.

Few companies are doing the hard work needed to align and integrate data – which means they won't capture the full value of digital transformation. Those hoping for a silver bullet to solve their data problems will be disappointed. Automation and cognitive will make it easier to get the work done, but it's still going to be hard and tedious. What are we talking about? Commas, abbreviations, data-entry fields, nomenclature, and hundreds of similar factors. It's not glamorous, and it's not glitzy. But it is important.

Work

Data governance is a bit like flossing. We know it's important, but we don't do it enough. That helps explain why data quality is a persistent challenge for finance organisations. Over the next few years, however, it would be wise to add Chief Data Officer to your job description. The work itself is down in the weeds, but you need to know that it's getting done.

Workforce

Every finance organisation needs at least one data evangelist, someone with the passion and the clout to drive continuous data improvement. Think of it as a moon shot – a concentrated effort over the course of a few years. Start by establishing sustainable protocols, and then begin the hard work of getting your data house in order.

Workplace

Data is a technology issue, but it's also a cultural issue. If you don't have leaders who value data quality, your organisation will struggle with data challenges that keep people from doing their best work. Instead of delivering insights and services to the business, these organisations are constantly backfilling, distracted by questions of data integrity and completeness.

Takeaway

Data problems hide beneath the surface for many CFOs, some of whom don't fully appreciate the heavy lifting required to fulfill their requests. That's partly because the problems involve technical issues, and partly because there's little motivation for people to elevate the problems to the corner office. No one wants to be the bearer of bad tidings.

What to do

- Convene a data summit with your finance technology team and those responsible for master data management. Ask for a review of the quality of data needed for critical business analysis.
- Identify areas where there's a pressing need for improvement. You may not really care about this now, but when you eventually do care (and you will), you're going to care a whole lot.

Automation and cognitive will make it easier to get the work done, but it's still going to be hard and tedious.

Workforce and workplace

Employees will be doing new things in new ways, some of which will make CFOs uncomfortable.

Finance talent models are evolving quickly, with a premium placed on data scientists, business analysts, and storytellers. This represents a dramatic shift for many finance organisations. To get ready, make sure your new hires represent the future you're striving for. Important qualities include a strong customer service orientation, flexibility, and good collaboration skills – in addition to the technical capabilities needed for specific jobs. Also, all of your people should be able to contribute to elevating the value of Finance in terms of communication, impact, and influence. Make every new hire count.

Work

With rule-based work largely automated, the focus shifts to business-facing analysis and exception-based investigations. More time will be spent on proactive support. Tools like predictive modeling, self-service reporting, and digital assistants enhance the capacity for employees to provide more advice on strategic interventions.

Workforce

The workforce of the future will bristle with cross-functional teams and constant collaboration. Finance organisations will need their people to be more flexible and open than they've ever been. Data scientists will work alongside business analysts to solve problems no individual could solve alone. Everyone will need more technical literacy, just as everyone will need a customer-service mindset.

Workplace

As the finance workplace evolves to embrace more self-service, expect to see digital assistants filling in where analysts used to operate. This technology will serve both customers of Finance and workers in Finance with new tools that make it easier to get information and make sense of it. This shift will elevate the importance of visualisation, as well as tools to keep people well-connected. Ironically, the future may require more physical proximity for teams, especially in the early phases of projects and work planning.

Takeaway

Implementing new technologies is relatively easy compared to changing your talent model. They're obviously connected, but cultural and organizational shifts related to your workforce may take much more time and care to get right. Your finance organisation should be looking at every new hire through the 2025 lens.

What to do

- Work with HR to define the talent requirements you think Finance is going to need. Identify people in your organization – as well as new hires – who exemplify the kind of talent you're striving for.
- If you want people to become more collaborative or technologically savvy, make sure you're evaluating them on those dimensions.
- Get comfortable being uncomfortable leading people with skill sets you don't fully understand.

All of your people should be able to contribute to elevating the value of Finance in terms of communication, impact, and influence. Make every new hire count.

What's next?

None of us knows for certain what the future will hold, but we all have a responsibility to be thinking about what's likely to happen, and to prepare for it. In Finance, that means working now to get the right people and technology in place to take advantage of the inevitable disruption ahead. That's not likely to happen without a clear vision and strategy for Finance in a digital world. Now is the time to step back and make sure your roadmap to that future is clear.

There's no doubt we'll be wrong about some of the predictions in this paper, just as there is no doubt we will be right about others. You can be certain that the automation trend will accelerate and expand in the next seven years. The cost-benefits are simply too large to ignore.

The years ahead hold great promise for finance organisations that want to create more value for the companies they support. Getting there may not be smooth and easy, but it will certainly be exciting. CFOs know their companies will benefit if Finance can more efficiently deliver better financial information in a more timely fashion. That's what Finance 2025 is all about.

“The best way
to predict the
future is to
create it.”

– Peter Drucker
