Introduction

The strategic things you do to grow your business or achieve your mission are at the heart of the cyber risks your organisation faces.

Most reports on cyber security revolve around a common theme: despite heightened attention and unprecedented levels of security investment, the number of cyber incidents – and their associated costs – continue to rise. They typically point to the growing sophistication of hackers and other adversaries as a particularly intractable problem, and some deliberate over whether being secure is even possible in today's rapidly evolving landscape of cyber-attacks.

Important questions, though, remain unaddressed. In particular, what are the underlying reasons for this trend and how can organisations actually reverse it to start winning the cyber risk battle?

The first question has a lot to do with your organisation itself. It is not just about the sophistication of external actors. Over the past two decades, we have woven a fabric of connectivity in our economy and society via the Internet – a platform that was designed primarily for sharing information, not protecting it.

Your organisation, whether functioning in the public or private sector, has undoubtedly benefited from this connectivity – driving innovation, efficiency and performance that were unthinkable a generation ago. You've likely used it to transform relationships with customers and constituents, to build new revenue streams or to overcome geographic constraints; or perhaps it has enabled you to gather data that shapes your market strategy, to accelerate the launch of products and services or to automate diverse operational systems.

You have probably also extended your capabilities through outsourcing, collaborating and the use of contractors, or you have engaged in reorganisations, mergers, acquisitions and divestitures. This increasing digital reach adds layers of complexity, volatility and dependence on infrastructure that is not fully within your control.

Your efforts to grow, serve, differentiate and streamline introduce new gaps and opportunities that attackers will try to exploit – because your adversaries, too, leverage the Internet to accomplish much more, much faster, and from anywhere. For every step you take, they will be close behind. In short, the strategic things you do to grow your business or achieve your mission are at the heart of the cyber risk your organisation faces.

When we consider this inherent link between business performance, innovation and cyber risk, it becomes clear that protecting everything — while perhaps not impossible — would be economically impractical and would likely impede some of your most important strategic initiatives. Some cyber incidents will occur. Every organisation must realistically assess its changing risk profile and determine what levels and types of cyber risk are acceptable. Managing your cyber risk is not a necessary evil. It is an essential aspect of enabling optimal business performance.

This brings us to the second question and the central theme of this paper. How can organisations reverse the growing gap between security investment and effectiveness in a world where it is not feasible to be 100% secure?

Given that you cannot prevent *all* cyber incidents, the traditional discipline of security, isolated from a more comprehensive risk-based approach, is not enough to protect you. Through the lens of what's most important to your organisation, you must invest in cost-justified security controls to protect your most important assets, but you must focus equal (in some cases greater) effort on gaining more insight into threats and responding more effectively to reduce their impact. Through an ongoing programme to become *secure, vigilant and resilient*, you can be more confident in your ability to reap the value of your strategic investments.

Being secure

You can't secure everything equally. Being secure means focusing protection around the risk-sensitive assets at the heart of your organisation's mission.

Traditional security controls, preventive measures and compliance initiatives have probably consumed the lion's share of your investment in cyber risk management, and you will most likely need to continue or increase your investment levels, because the stakes have never been higher.

However, you may need to rethink your decision criteria. Malicious actors, especially those motivated by financial gain, tend to operate on a cost/reward basis; if your defences are strong enough to *raise their risks* and level of effort relative to the *value* of what they can gain, they are more likely to turn their attention elsewhere.

"Value" is a pivotal qualifier. Given the reach and complexity of your digital ecosystem, you can't secure everything equally. Being secure means focusing protection around the risk-sensitive assets at the heart of your organisation's mission – the ones that both you and your adversaries are likely to agree are the most valuable.

Among the most important elements are critical infrastructure, applications and data, as well as specialised control systems – but they're not isolated components. They're part of larger services and transaction chains, so it is essential to address weak points along the end-to-end business process, with the awareness that insiders, vendors and trusted partners at any point can be the source of errors or intentional actions that open the door to incidents.

If you've historically underinvested in security, this should be remedied, but improving security is not always about spending more money – and it's also not just about buying the latest security tools. Many organisations can do significantly better by instilling better discipline in some basic areas. One such area is data tracking and classification.

Many organisations don't know where their sensitive data actually resides. It is probably sitting in more places than you think – both inside and outside your organisation – being viewed and shared by more people than necessary. Effort should be taken to streamline and control access wherever possible.

Another common and closely related area of weakness is asset management. Large organisations generate enormous change on a daily basis – new users, new devices, new applications, and supporting changes to the underlying infrastructure. If security controls are not adjusted to keep pace, you're likely to create gaping holes that can leave your organisation exposed for days, months or even years.

A closer look

Strong asset management is a significant enabler of *secure, vigilant and resilient* practices.

For example, proper reconfiguration and decommissioning of laptops and servers is critical in preventing data leakage. Mature processes maintain up-to-date tagging of critical assets that support high-risk areas of the business.

This intelligence can be used in conjunction with monitoring technologies to prioritise attention to security alerts – helping analysts to discern the difference between a minor event and one that could potentially escalate into a business crisis.

Being vigilant

By carefully plotting the motives and psychology of adversaries, and considering the potential for accidental damage, cyber risk strategists anticipate what might occur and design detection systems accordingly.

Today's costliest attacks tend to be the ones that are highly targeted – at *you*, for specific reasons. Being vigilant means establishing threat awareness throughout the organisation and developing the capacity to detect patterns of behaviour that may indicate, or even predict, the compromise of critical assets.

Collecting terabytes of data, security operations centres can generate tens of thousands – sometimes literally *millions* – of alerts daily. Analysts are overloaded partly because detection is focused on infected machines, malicious IP addresses or failed login attempts. Those details *may* be important; but without context, it is impossible to know whether you're seeing what really matters.

Yesterday's relatively isolated malicious activity has given way to well-organised cyber-crime enterprises and networks of politically motivated, and sometimes state-sponsored, attackers. They might steal data for financial gain, discover strategic plans for competitive advantage or disrupt critical infrastructure to cause chaos or inflict economic damage. Relentless, sophisticated and patient, they stage attacks over time until they get what they're after. Sometimes your employees or partners – wittingly or inadvertently – are accomplices.

Your efforts to be vigilant start with a solid picture of what you need to defend against. There are discernable threat trends across whole industry sectors. Knowing the landscape within your industry is an important starting point that needs to be supplemented by an understanding of your organisation's specific business risks. It is a broad exercise to examine who could harm you, what motivates them and how they are likely to operate. By carefully plotting the motives and psychology of adversaries and considering the potential for accidental damage by well-intentioned customers, partners or employees, cyber risk strategists anticipate what might occur and design detection systems accordingly.

This is a business challenge, not just a technical one. Executives need enough understanding of the threat landscape to provide cyber risk guidance. It is then the job of your technical teams to translate this into effective operational capabilities, and these capabilities must be continually adapted. Every innovation creates new possibilities for misuse or abuse to occur. For every innovation and every new control put in place, malicious actors will try to find the cracks and seep through them. You must adjust and pre-empt them.

A closer look

Detecting persistent and targeted threats requires broad organisation-wide collaboration and, therefore, strong governance.

First, because they require ongoing access to a very broad range of data – not just from IT devices and systems, but also business information as diverse as employee rosters, customer usage patterns, inventory records, financial records, and potentially data from non-traditional digital sources such as facial recognition systems, facilities access records, telephony records, industrial control systems, and the list goes on.

Second, the designers of these capabilities require deep engagement with business leaders to understand what “normal” activity and indicators of risk look like.

A closer look

Malicious insider attacks are not impulsive. Rather, individuals move on a continuum from ideation to action, exhibiting certain behavioural indicators along the way. Insider acts often trigger potential risk indicators in three categories:

- Virtual actions, such as emails sent and databases accessed
- Non-virtual actions, perhaps unexplained absences
- Contextual descriptors, such as user access and privileged rights

Revealing at-risk employees requires correlation of data across these categories to connect the dots to discover relevant patterns over time.

Being resilient

If response to cyber incidents is viewed as primarily a technical function, you will likely not be equipped for decisive action.

Your technical teams handle many day-to-day, fairly routine security events. However, some incidents may become serious *business crises*, which can affect your organisation's broader mission. Being resilient means having the capacity to rapidly contain the damage and mobilise the diverse resources needed to minimise impact – including direct costs and business disruption, as well as reputation and brand damage.

If response to cyber incidents is viewed as primarily a technical function, you will likely not be equipped for decisive action on whether or not components of your operations should be taken off line, what to report to authorities and how to collaborate with law enforcement. You may also be less nimble in resuming normal operations and less able to manage the perception of the public and other stakeholders such as customers, investors and regulators.

While resilience requires investment in traditional technology-based redundancy and disaster recovery capabilities, the bigger picture includes a complete set of crisis management capabilities. It involves IT, of course, but also various business and department leaders, and decision-makers from legal, risk, human relations and communications functions. It requires a playbook across all these entities, designed in advance by considering how threat scenarios that affect critical assets and processes could play out.

Playbooks and policies must be written, but it is equally important to rehearse them through cyber war-gaming and simulations that bring together business and technology teams. Staging simulations creates better organisational awareness and understanding of threats, improves cyber judgement, and plants the seeds of “muscle memory” that helps teams respond flexibly and instinctively to both the scenarios you envisioned and the situations that couldn't be foreseen.

Finally, incident response and crisis management must feed continuous improvement processes. Resilient organisations take the time to absorb important lessons and to modify the secure and vigilant aspects of the programme to emerge stronger than before.

A closer look

Cyber war-gaming exercises reveal common issues that cause delays in responding as rapidly and effectively as a real crisis situation would warrant:

- Groups accustomed to operating in silos face challenges in coming to agreement on the relative severity of an incident, and therefore of the key actions needed.
- Roles and responsibilities, though they may be outlined in a process manual, are not well understood.
- The lack of awareness of law enforcement structures and legal process causes failure to capture valuable forensic evidence.

It won't work without governance

A *Secure.Vigilant.Resilient.* cyber risk programme is not just about spending money differently – it's a fundamentally different approach.

Transforming from a traditional, standards-driven IT security programme to a *Secure.Vigilant.Resilient.* cyber risk programme is not just about spending money differently – it is a fundamentally different approach – and your programme will be unique to you. The balance of investment in *secure, vigilant and resilient* capabilities will vary between organisations and will even be applied differently to the various areas within your organisation.

Secure.Vigilant.Resilient. programmes have some common characteristics:

- **They are executive-led.** Executive leaders must set the stage by defining cyber risk management priorities, risk appetite and mechanisms of accountability. Sponsorship at the top is essential in rallying diverse groups and departments to collaborate in new ways.
- **They involve everyone.** Although specific roles need to be well defined, the programme is not the sole responsibility of a single part of the organisation. It requires broad horizontal and vertical participation and behavioural change throughout the enterprise.
- **They are programmes, not projects.** Although it usually requires a series of projects to get off the ground, *Secure.Vigilant.Resilient.* is an agile and adaptive programme that requires continuous review and improvement cycles to adapt to changes in the business risk and threat landscapes.
- **They are comprehensive and integrated.** The *secure, vigilant and resilient* elements are not distinct silos of activity. They are a set of lenses through which every essential business process and growth initiative should be evaluated or planned. Each one involves people, process and technology components. Done well, each will improve the others.
- **They reach beyond your walls.** Your ecosystem includes various partners, suppliers and vendors. Significant cyber incidents directly affecting them may also substantially affect you.

These transformations can't take place without strong governance. Instituting a *Secure.Vigilant.Resilient.* programme requires a carefully guided evolution – changes in roles, processes, accountability measures, well-articulated performance metrics and, most of all, an organisation-wide shift in mindset.

A closer look

It's a living thing. Any initiative where risk-sensitive areas of the business are enabled by digital assets should be considered through a *secure, vigilant, resilient* lens. Examples might include:

- A sales executive decides to empower the sales force and channel partners with mobile sales tools.
- A project team is charged with consolidating equipment and revising corporate network access for employees and contractors as part of a significant organisational realignment effort.
- A chief operations officer decides to invest in new RFID-based automation for manufacturing and inventory processes.

Walking the talk

In the pace of today's climate, organisations cannot afford to slow innovation simply because it cannot be perfectly secured. Nor can they innovate without appropriate regard for the inherent risks being generated.

Where to begin will depend on where you are today. If you are early in a transformation process, the following steps can help you to move in the right direction:

- 1) Put a senior executive at the helm. A cyber crisis situation requires a strong leader to drive cohesive, decisive action. But, establishing the foundation requires someone with broad influence who can generate collaborative engagement among the diverse range of players essential to the success of the programme – most of whom may be unaccustomed to thinking about cyber risk. The person in charge of the *Secure.Vigilant.Resilient* programme must be able to lead in both capacities, and be respected among a wide range of leaders, and at the board level.
- 2) Map threats to the business assets that matter. Create a high-level cyber risk guidance matrix by gathering top business leaders and threat intelligence specialists to pre-emptively discuss the potential threat actors and trusted insiders who could cause harm, the damage they could impose and how they might do it. Through this threat-centric lens, identify significant areas of unaddressed cyber risk. Set your risk appetite and prioritise programme areas that embody your strategy for becoming *secure, vigilant and resilient*.
- 3) Launch priority projects for early “wins”. Establish momentum by focusing on several areas or pilot initiatives that directly affect business success or mission achievement, with objectives that can be measured, and with built-in continuous improvement processes. By maintaining focus and demonstrating results, you can plant the seeds of a *Secure.Vigilant.Resilient* culture that has a long-term, sustainable impact.
- 4) Accelerate behavioural change through incentives and experience-based awareness. Traditional security training is an important programme component, but on its own is not enough, as evidenced by the number of breaches that can be traced back to stolen laptops, weak passwords or failure to follow secure application development protocols. In a typically busy and stressful work environment, a policy manual alone will not prepare people to take the right action. Therefore, create some active learning scenarios that deepen understanding of the impact of day-to-day activity on the organisation's cyber risk posture, and identify visible opportunities to reinforce the right behaviour through programmes that reward speaking up, raising questions and achieving core *Secure.Vigilant.Resilient* programme objectives.

Becoming *secure, vigilant and resilient* requires that the organisation embrace a fundamentally different view of what we've previously called “security”. Yesterday's security programme was often perceived as a burden – an externally imposed set of restrictions, rules and procedural hurdles that impeded business initiatives. Security rigour has been pitted against progress, striking up battles over the budgets and timelines of strategic initiatives. Depending on which prevailed at any given point, the net result has too often been either recklessly risky innovation or a degree of caution that leads to lost opportunities.

In the pace of today's climate, organisations cannot afford to slow innovation simply because it cannot be perfectly secured. But, neither can they innovate without appropriate regard for the inherent risks being generated. Cyber risk and innovation are inextricably linked. Rather than subordinating one to the other, senior executives must harmonise these important elements of business performance through a programme to become *secure, vigilant and resilient*.
