

## What is Technology Value Assurance?

- An audit, is an audit, is and audit ... Due to the evolving global assurance landscape, that is how organisations are starting to view their annual statutory financial audit. Audits are becoming commodity services, with no or limited value being added beyond the standard audit mandate. Due to evolving regulatory requirements and increasing market pressures, organisations require a broader focus on Business Strategies, Governance and Internal Controls.
- Deloitte's Technology Assurance & Advisory (TAA) has developed a unique approach to IT Assurance engagements. We bring a business mind-set combined with deep technical knowledge and extensive industry experience to assist clients to address business issues across the broad spectrum of accounting, security and privacy, governance, process improvement, data analytics and risk advisory disciplines.

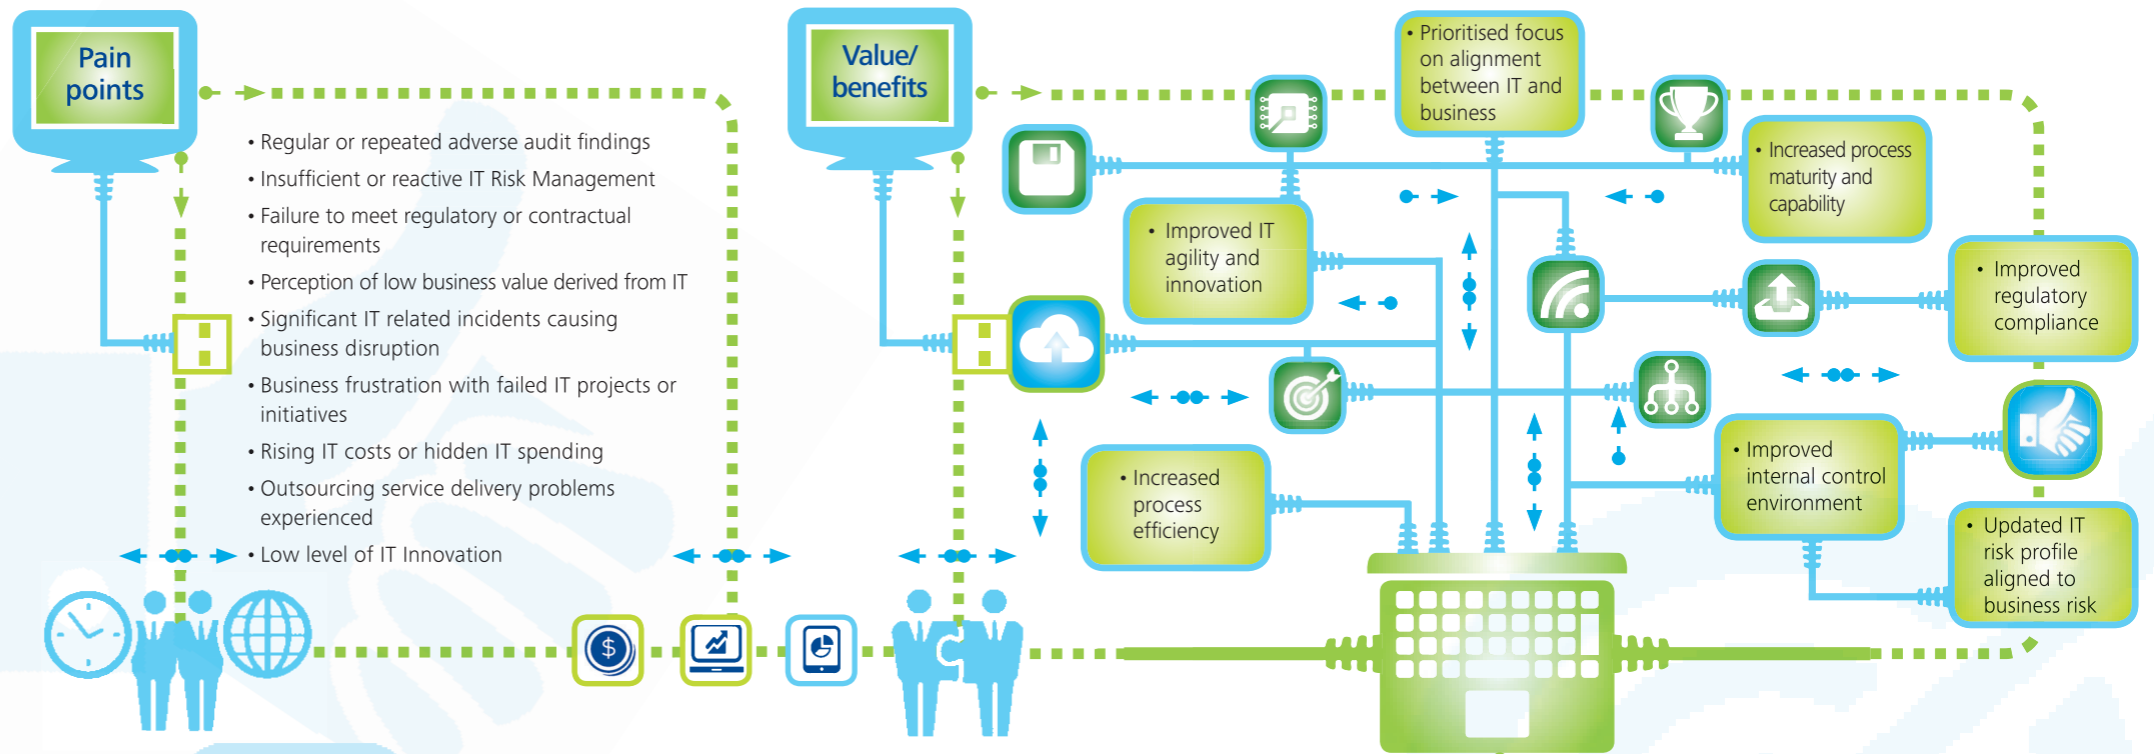

## TVA helps organisations answer the following key questions critically and honestly

- What are the Governance deficiencies that are causing operational control failures?
- What is the role of IT in your business?
- What is the condition of IT?
- Are you getting the envisaged value from IT?
- What are your key IT pain points and risks?
- How do you enhance technology to be a strategic enabler?
- Which IT priorities should you focus on?
