

# Systems Integration

## A simplified application integration architecture

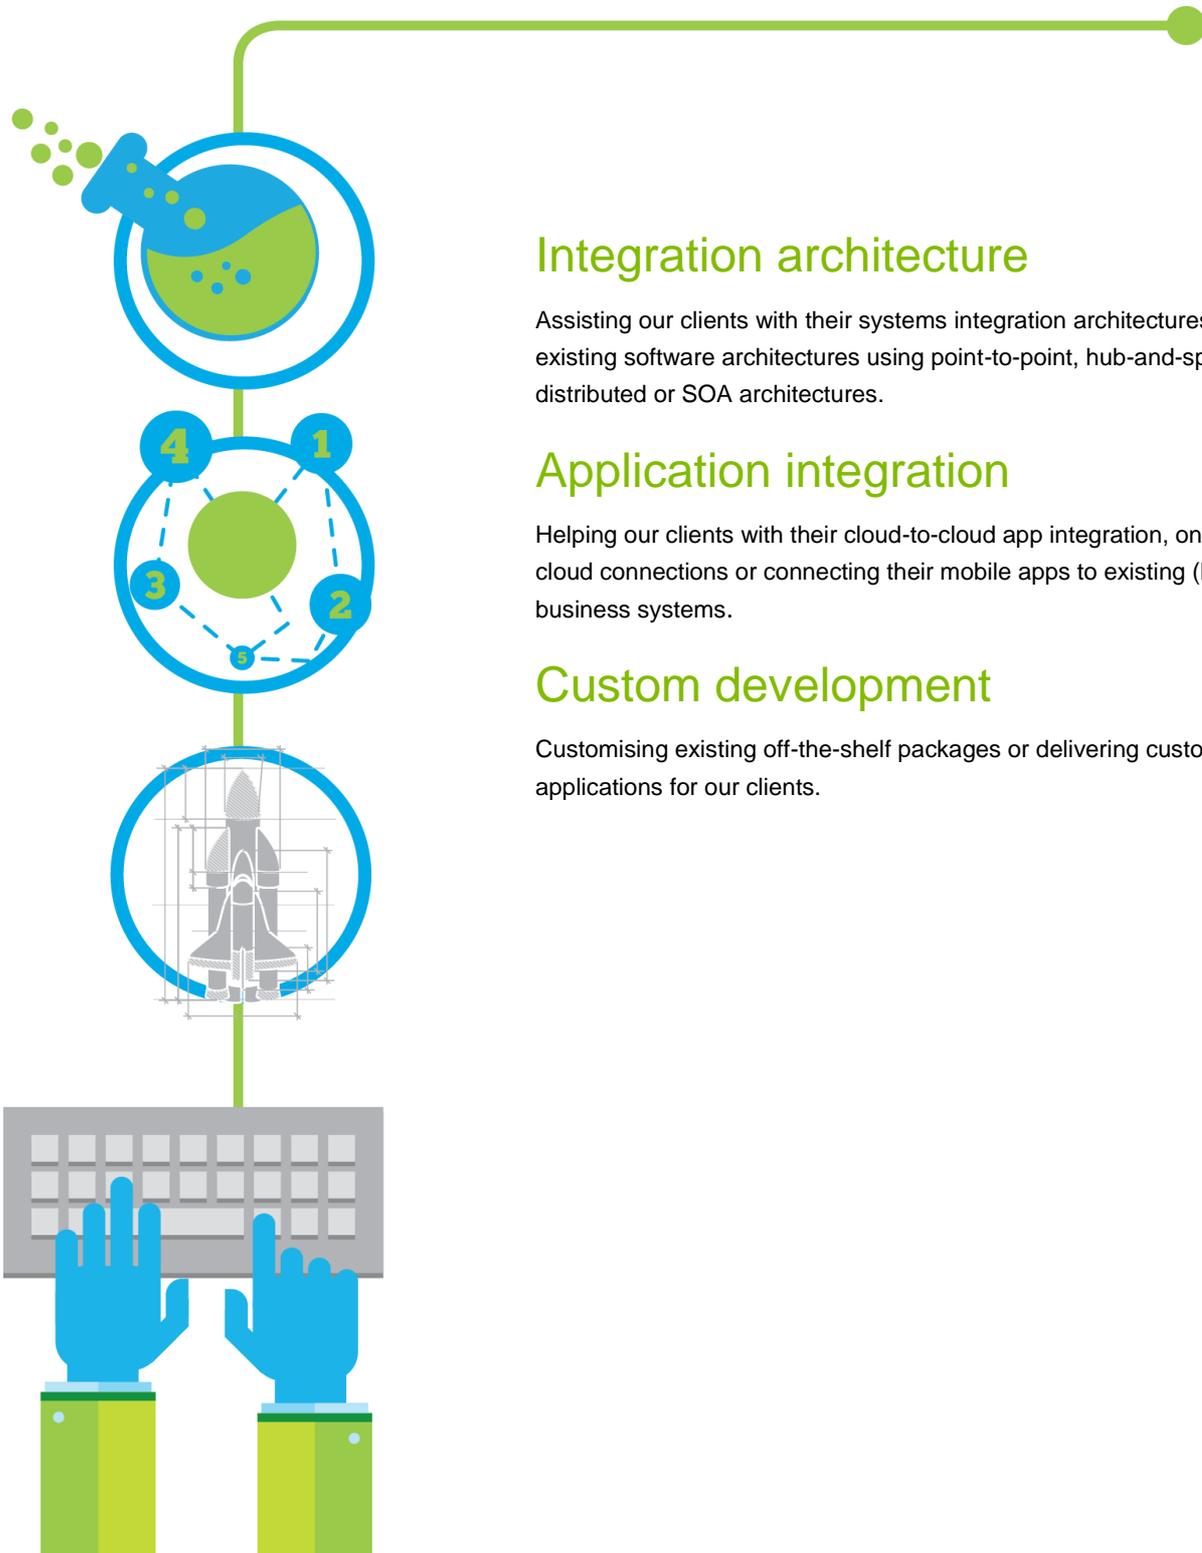

When IT cannot stretch to take on new projects or business initiatives without losing ground somewhere else, something has to give. This is precisely the predicament that many IT organisations discover or are faced with when unexpected new challenges such as a mergers or acquisitions; new product launches or having to rapidly and seamlessly integrate new software architectures (such as cloud and mobile) into their existing environments to deliver the expected business benefit.

Part of the problem is the technology infrastructure itself, which may not be able to accommodate new solutions effectively. As highlighted, capability to integrate these new solutions and related capacity is also a typical bottleneck for business change, but people's reactions are just as important. After years of working with the same infrastructure, they may not be prepared to embrace a new one quickly enough.

Systems integration assists by allowing companies to focus on the roots of their technology problems without starting from scratch, improving the ways in which their solutions connect with and complement one another.

# Systems integration services we offer

## Integration architecture

Assisting our clients with their systems integration architectures to extend existing software architectures using point-to-point, hub-and-spoke, distributed or SOA architectures.

## Application integration

Helping our clients with their cloud-to-cloud app integration, on-premise to cloud connections or connecting their mobile apps to existing (legacy) business systems.

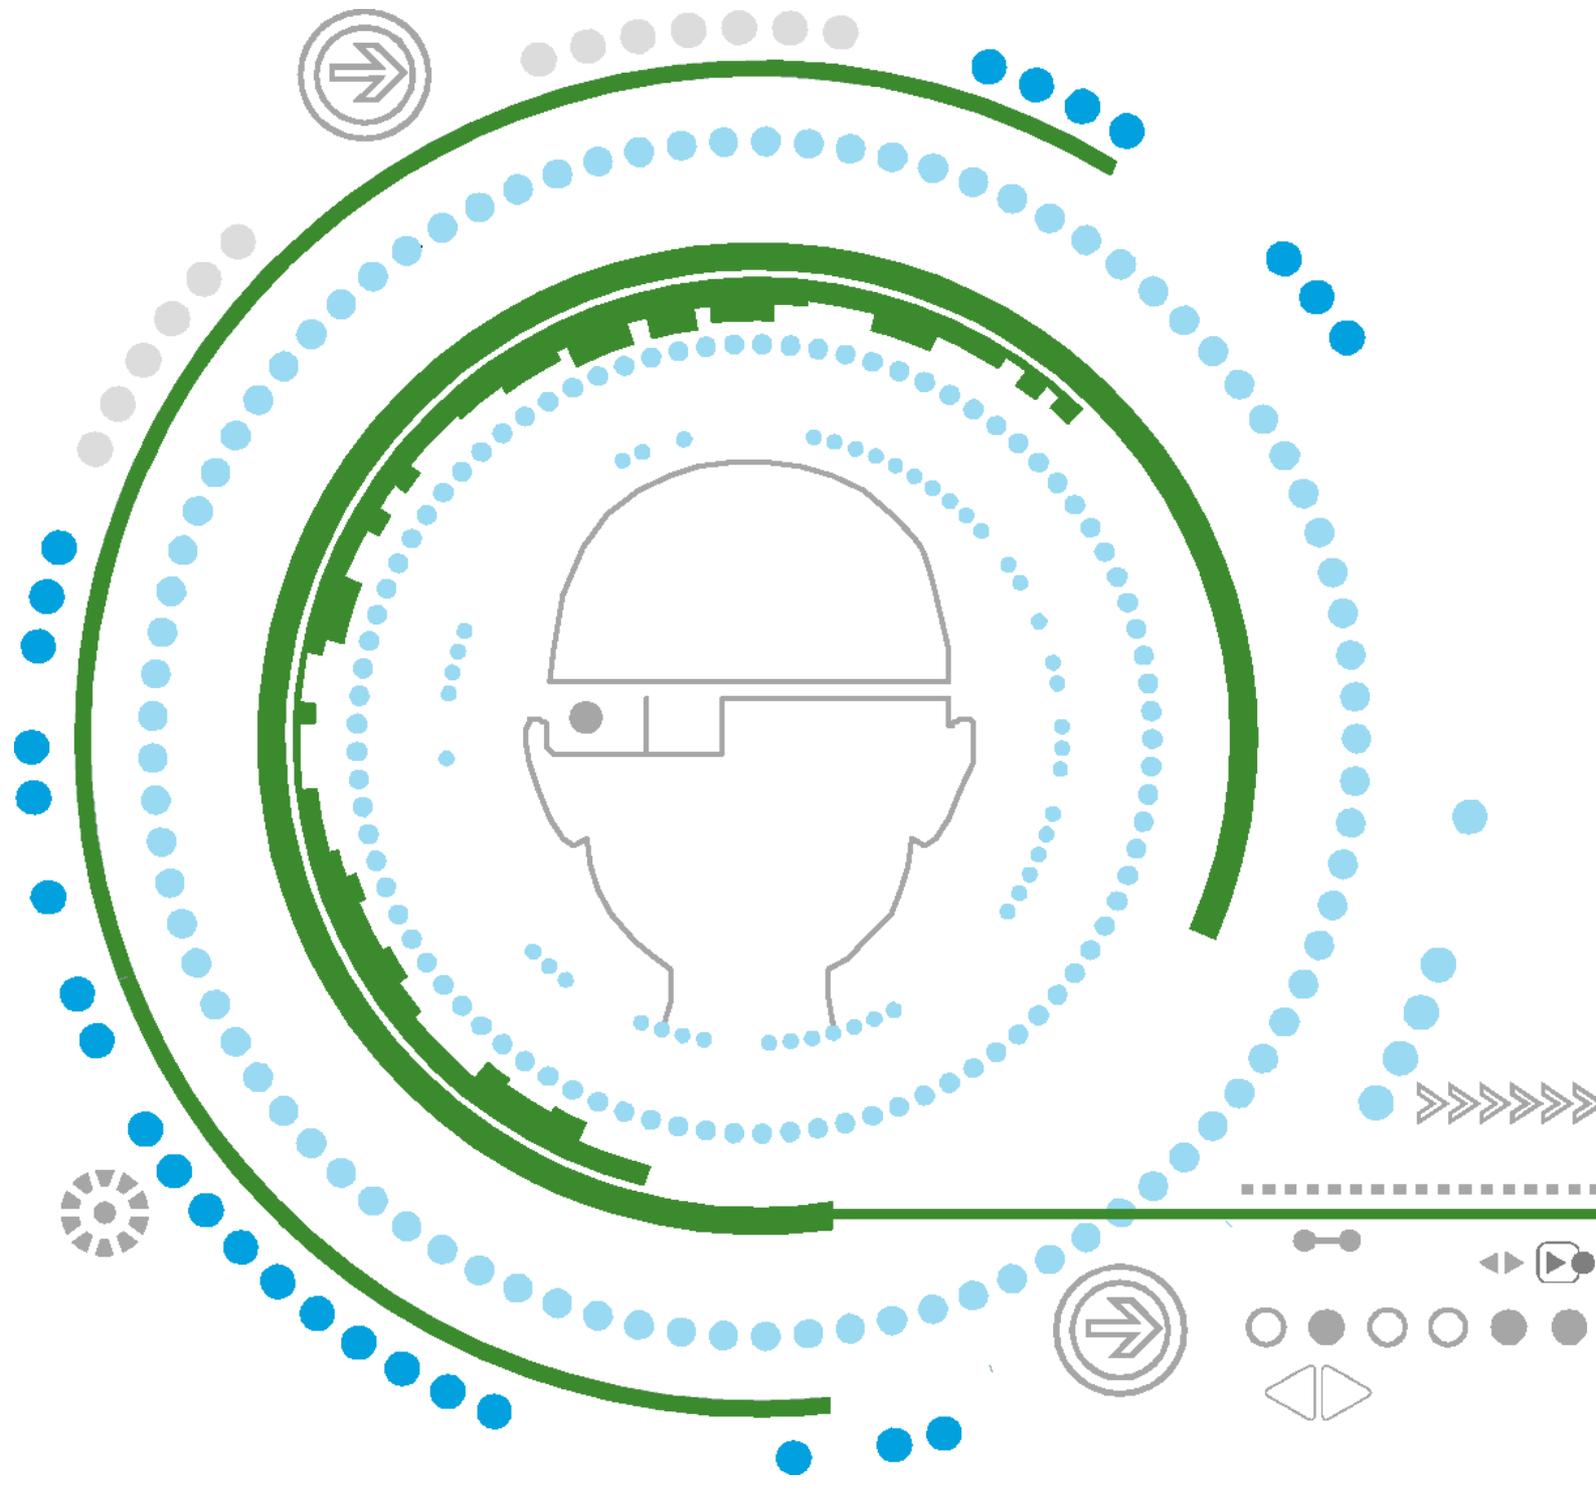

## Custom development

Customising existing off-the-shelf packages or delivering custom developed applications for our clients.

## Solution architecture

If they could start from scratch, most IT leaders would probably do many things differently. This is because as their businesses build new capabilities, adopt new technologies and take on new challenges, the resulting tangle of solutions often leaves much to be desired. Systems don't work well with one another. It's harder to support important business goals. Manual processes persist where automation should reign. But executives can't fight every battle with limited resources, and starting from scratch is typically not an option. So when is it really time to make a change – and what's a smart way to go about it?

That's where our integration architecture service offering can help. By helping our clients extend their existing software architectures using point-to-point, hub-and-spoke, distributed, cloud based or service orientated integration architectures.

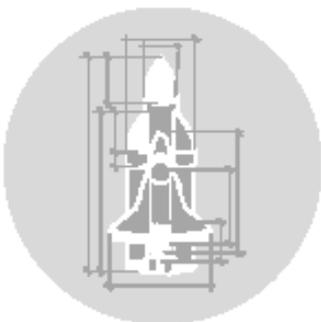

# A simplified systems integration architecture

Mobile to line-of-business systems. Easily connecting your new mobile apps to your legacy line-of-business systems.

Cloud-to-cloud integration. Connecting your new cloud based applications with ease for smoother processing.

On-premise to cloud. Connecting your legacy on-premise systems to your new cloud based application architecture.
