In Brief

Nearly all US consumers purchase some form of fresh food every month—produce, meat, fish, and dairy, to name a few. According to our recent survey of 2,000 US adults, 74 percent buy fresh foods at least once a week, and more than 60 percent spend up to a third of their average grocery budget on this category. Yet fresh food sales in the United States are lagging behind total grocery store sales: Between October 2015 and October 2018, total store sales grew 4.3 percent, while fresh food sales grew only 4.0 percent, from US$171 billion to US$178 billion.\(^1\)

How can fresh food producers and retailers grow this category? One key is to understand that fresh food consumers are not a single homogeneous group. Our segmentation analysis of survey respondents, based on their attitudes and purchasing behavior, reveals three distinct types of fresh food buyers—Forwards, Followers, and Neutrals—each with its own distinct expectations and buying patterns (figure 1).

An analysis of each segment’s attitudes about health and wellness, food safety/sustainability, and sourcing with respect to fresh food purchases reveals some important differences. For Forwards, health and wellness was more important than the other two factors. Perhaps as a result, this group was more likely to pay a higher price for fresh foods. However, among Followers and Neutrals—who accounted for more than two-thirds of our sample—price was most important. This suggests that there is likely a price threshold these consumers will not cross, and that competitive pricing remains important to them.
Interestingly, among Forwards, health and wellness concerns rose to the top when considering other types of food as well. This suggests that their desire for health and wellness products is a function of their attitudes rather than age—which also implies that as Forwards age, they will likely maintain their beliefs and not necessarily become Followers. They are more likely to evolve into a new segment of middle-aged adults with higher incomes interested in fresh foods. To track this evolution, manufacturers and retailers may wish to revisit this segmentation every three to five years due to this category’s dynamic nature.

As far as near-term profitability goes, if demand can be stimulated among Followers, the largest group of fresh food consumers, even small growth within this group could be beneficial to the broader fresh food category. Such targeted consumer analysis, coupled with enhancements on the manufacturing end, can truly help realize the growth potential of fresh foods.
